Project Personnel

Project Director	Daniel Eusebi BES, RPP, MCIP., Senior Principal Ecologist
Project Manager	Stuart Smith M.Sc., Environmental Scientist
Project Coordinator	Kevin McGillycuddy, B.A. (Mod), M.Sc., PIEMA, Associate Environmental Consultant
Archaeological Lead/Licensee	Michael Teal, M.A. (P364), Archaeology Team Lead – Ontario Earth and Environment
Archaeology Coordinator	Allison Nott, B.A. (R460), Archaeologist
Field Directors	Nicole Gavin, M.A. (P1288), Archaeologist
Field Assistants	Jamie Steinberg, Jessica Figura, William Pettes, Goncalo Bispo, Cheyenne Cameron, Diego Jiminez, Brianne Graves, Mike Grajner, Tom Malcolm, Ilmar Kansberg, Cheyenne Romeo, Nick Cook
Indigenous Liaisons	<p>Huron-Wendat First Nation: Not on site</p> <p>Mississaugas of the Credit First Nation: Joe Gouthro, Alison Laforme, Eric Laforme, Steven Sault, Ronald Harris, Baylee Sault</p> <p>Haudenosaunee Development Institute: Sam Williams, Randy Henry</p> <p>Six Nations of the Grand River: Danielle Hughes, Colleen McNaughton</p>
Lab Technician	<p>Nicole Gavin, Archaeologist</p> <p>Mackenzie Litwin, Archaeologist</p>
Material Culture Analyst	<p>Lindsay Dales, M.A., Archaeologist (P328)</p> <p>Helen Moore, B.A., Archaeologist (R359)</p>
Report Production	<p>Rebecca Meichenheimer, M.A., Archaeologist (P1013)</p> <p>Shannon Neill-Sword, Archaeologist</p> <p>Helen Moore, Archaeologist</p>
GIS/Mapping	Bojan Radojevic, GIS Analyst
Senior Review	Michael Teal, M.A.
Administrative Support	Lekha Diwan, Administrator

Acknowledgements

We respectfully acknowledge that the Study Area is located in the traditional territory of multiple Indigenous groups, including the Mississaugas of the Credit First Nation, Six Nations of the Grand River (the Haudenosaunee), the Huron-Wendat First Nation, and the Métis Nation of Ontario.

Executive Summary

The Executive Summary highlights key points from the report only; for complete information and findings, as well as the limitations, the reader should examine the complete report.

Golder Associates Ltd. (Golder), now WSP Canada Inc. (WSP), was retained by CBM Aggregates, a division of St Marys Cement Inc. (Canada), to conduct a Stage 3 Archaeological Assessment (AA) of Location 1 (AkHa-23), a historical Euro-Canadian site located within the license boundary for the proposed Caledon Pit/Quarry (the Study Area; Map 1). The Stage 3 AA was conducted to meet the requirements of the *Aggregate Resources Act* R.S.O. 1990, c.A.8. (Government of Ontario 1990a), and the Town of Caledon Official Plan and Zoning By-law Amendment under the *Planning Act*, R.S.O 1990, c.P.14 (Government of Ontario 1990b).

Golder previously completed a Stage 1 and 2 AA of the Study Area for the proposed Caledon Pit/Quarry under Project Information Number (PIF) P364-0164-2020 (Golder 2022). The area assessed is approximately 261.2 hectares (ha) located within part of Lots 15 to 17, Concession 4 West of Centre Road (WSCR), as well as part of Lot 16, Concession 3 WSCR, in the geographic Township of Caledon, former County of Peel, now the Town of Caledon, Regional Municipality of Peel (Peel Region) (Map 1). It consists predominately of cultivated fields in addition to uncultivated farmland (i.e., pastures), farmstead/residential areas, and wooded areas.

The Stage 1 and 2 AA resulted in the identification of 29 new archaeological sites (Locations 1 through 29) (Golder 2022) and re-established the location of the Cameron Site (AlHa-9), which was previously identified in 2001 (Archaeological Assessments Ltd. 2001). Of the 30 archaeological sites within the Study Area, a total of 14 were considered to have further cultural heritage value or interest and Stage 3 AA was recommended.

Location 1 (AkHa-23) is one of the 14 sites that was recommended for Stage 3 AA. It is a historical Euro-Canadian site that was identified through a combination of Stage 2 test pit survey of a former residential lot and Stage 2 pedestrian survey of the surrounding agricultural field. The site is located over an area measuring 80 m (north-south) by 70 m (east-west) within part of Lot 15, Concession 4 WSCR (Supplementary Documentation; Map SD1).

The Stage 3 AA of Location 1 (AkHa-23) consisted of the hand excavation of 57 test units across an area measuring approximately 80 m north-south by 70 m east-west. The Stage 3 excavations resulted in the recovery of 7,692 total artifacts, of which 6,133 were found from an intact context and 1,559 were found from a disturbed, fill context. The assemblage from an intact context includes 5,677 historical Euro-Canadian artifacts and 20th century items, 454 faunal elements, and two pre-contact Indigenous artifacts. The Stage 3 excavations also resulted in the identification of seven subsurface cultural features.

The Location 1 (AkHa-23) artifact assemblage consists of material that is typically associated with domestic occupations, including structural items (n=2,433; 43% of the total assemblage), food/beverage related artifacts (n=1,680; 30% of the total assemblage), and artifacts with an indeterminate function (n=1,213, 21% of the total assemblage). The dateable assemblage (n=2,561; 45.1% of the total assemblage) consists mostly of nails (54% of the dateable assemblage) and tableware (31.5% of the dateable assemblage), which primarily date to the mid- or late 19th century, except 29 sherds of tableware that date to the 20th century. Overall, the late 19th and 20th century material consists of 53% of the dateable assemblage, with the remaining 47% dating to the mid- 19th century. No artifacts were recovered which date to the early 19th century.

Location 1 (AkHa-23) is interpreted to be a domestic refuse site and homestead associated with the continuous occupation of the property from the mid-19th century through to the 21st century. Historically, Location 1 (AkHa-23) relates to the mid- to late 19th and 20th century occupation by the McNichols family who owned the eastern half of Lot 15 until it was sold in 1912.

Based on the findings enclosed in this report, WSP concludes that a sufficient level of archaeological data has been revealed to provide an understanding of the mid- to late 19th century occupation of the McNichols family and assess the CHVI of the site. Location 1 (AkHa-23) does not meet Standard 2c of Section 3.4 of the Draft RHF Standards (Government of Ontario 2021), or Standards 1a-b of Section 3.4.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for domestic archaeological sites dating after 1830. As such, the historical Euro-Canadian component of Location 1 (AkHa-23) is determined to have been sufficiently documented and is concluded to have no further CHVI. Therefore, Location 1 (AkHa-23) does not require Stage 4 mitigation prior to development impacts.

The pre-contact Indigenous artifact assemblage from Location 1 (AkHa-23) consists of two pieces of lithic debitage made of Onondaga chert. Lithic debitage is not a diagnostic artifact type and therefore cannot be assigned a specific occupational time period or specific cultural affiliation. The isolated nature of the artifacts could be attributed to being inadvertently intermixed with the historical material and redeposited sometime during the historical occupation.

Based on the results of the Stage 3 AA of Location 1 (AkHa-23), and the analysis and conclusions presented in Section 6.0, Location 1 (AkHa-23) has no further cultural heritage value or interest and is not recommended for Stage 4 mitigation of impacts.

The Ontario Ministry of Citizenship and Multiculturalism is asked to review the results and recommendations presented herein, accept this report into the Provincial Register of archaeological reports and issue a standard letter of compliance with the Ministry's 2011 *Standards and Guidelines for Consultant Archaeologists* and the terms and conditions for archaeological licencing.

Study Limitations

WSP has prepared this report in a manner consistent with that level of care and skill ordinarily exercised by members of the archaeological profession currently practicing under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this report. No other warranty expressed or implied is made.

This report has been prepared for the specific site, design objective, developments, and purpose described to WSP by CBM Aggregates, a division of St. Marys Cement Inc. (the Client). The factual data, interpretations, and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location.

The information, recommendations, and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without WSP's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the Client, WSP may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to WSP. The report, all plans, data, drawings, and other documents as well as electronic media prepared by WSP are considered its professional work product and shall remain the copyright property of WSP, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report by those parties. The Client and Approved Users may not give, lend, sell, or otherwise make available the report or any portion thereof to any other party without the express written permission of WSP. The Client acknowledges that electronic media is susceptible to unauthorized modification, deterioration, and incompatibility and therefore the Client cannot rely upon the electronic media versions of WSP's report or other work products.

Unless otherwise stated, the suggestions, recommendations, and opinions given in this report are intended only for the guidance of the Client in the design of the specific project.

Special risks occur whenever archaeological investigations are applied to identify subsurface conditions and even a comprehensive investigation, sampling and testing program may fail to detect all or certain archaeological resources. The sampling strategies incorporated in this study, if any, comply with those identified in the Ministry of Citizenship and Multiculturalism 2011 *Standards and Guidelines for Consultant Archaeologists*.

APPENDICES

APPENDIX A

Location 1 (AkHa-23) Artifact Catalogue

1.0 PROJECT CONTEXT

1.1 Development Context

Golder Associates Ltd. (Golder), now WSP Canada Inc. (WSP), was retained by CBM Aggregates, a division of St Marys Cement Inc. (Canada), to conduct a Stage 3 Archaeological Assessment (AA) of Location 1 (AkHa-23), a historical Euro-Canadian site located within the license boundary for the proposed Caledon Pit/Quarry (the Study Area; Map 1). The Stage 3 AA was conducted to meet the requirements of the *Aggregate Resources Act* R.S.O. 1990, c.A.8. (Government of Ontario 1990a), and the Town of Caledon Official Plan and Zoning By-law Amendment under the *Planning Act*, R.S.O 1990, c.P.14 (Government of Ontario 1990b).

Golder previously completed a Stage 1 and 2 AA of the Study Area for the proposed Caledon Pit/Quarry under Project Information Number (PIF) P364-0164-2020 (Golder 2022). The area assessed is approximately 261.2 hectares (ha) located within part of Lots 15 to 17, Concession 4 West of Centre Road (WSCR), as well as part of Lot 16, Concession 3 WSCR, in the geographic Township of Caledon, former County of Peel, now the Town of Caledon, Regional Municipality of Peel (Peel Region) (Map 1). It consists predominately of cultivated fields in addition to uncultivated farmland (i.e., pastures), farmstead/residential areas, and wooded areas.

The Stage 1 and 2 AA resulted in the identification of 29 new archaeological sites (Locations 1 through 29) (Golder 2022) and re-established the location of the Cameron Site (AlHa-9), which was previously identified in 2001 (Archaeological Assessments Ltd. 2001). Of the 30 archaeological sites within the Study Area, a total of 14 were considered to have further cultural heritage value or interest (CHVI) and Stage 3 AA was recommended.

Location 1 (AkHa-23) is one of the 14 sites that was recommended for Stage 3 AA. It is a historical Euro-Canadian site that was identified through a combination of Stage 2 test pit survey of a former residential lot and Stage 2 pedestrian survey of the surrounding agricultural field. It is located over an area measuring 80 m (N-S) by 70 m (E-W) within part of Lot 15, Concession 4 WSCR (Supplementary Documentation; Map SD1).

The Stage 3 AA was conducted under professional license P364, issued to Michael Teal of WSP by the MCM (PIF P364-0200-2022). All activities undertaken during the assessment followed the *Ontario Heritage Act* and the MCM's (2011) *Standards and Guidelines for Consultant Archaeologists*. All fieldwork occurred between May 18 and July 19, 2022. Permission to access the Study Area to conduct all required archaeological fieldwork activities, including the recovery of artifacts, was provided by CBM Aggregates.

1.2 Objectives

The Stage 3 AA was completed with the following objectives:

- To determine the extent of the archaeological site and the characteristics of the artifacts.
- To collect a representative sample of artifacts.
- To assess the cultural heritage value or interest (CHVI) of the archaeological site.
- To determine the need for mitigation of development impacts and recommend appropriate strategies for mitigation and future conservation.

2.0 HISTORICAL CONTEXT

The following historical narrative is intended to provide a general overview of the interpreted land use during the “Pre-Contact Period” and “Early Contact Period” within the vicinity of the current study area. This historical overview is primarily based on archaeological and historical interpretations inferred over the past 50 years, and generally reflect inferences and interpretations made by non-Indigenous representatives.

The text below is not intended to provide a comprehensive historical overview of the landscape prior to, and following the arrival of Europeans to Ontario, but rather provide a general overview context that can be referenced when determining the potential for archaeological resources within the current project study area.

The text and comments below, including the cited references, may reflect archaeological and contemporary literature within general publications, but may not represent the opinions of those Indigenous communities whose history it is purported to reflect.

2.1 Pre-Contact Indigenous Period

The general culture history of southern Ontario based on Ellis and Ferris (1990) is summarised in Table 1, while Map 2 displays the pre-contact Indigenous culture history of southern Ontario.

Table 1: Overview of cultural chronology of southern Ontario.

Period		Time Period (circa)	Characteristics
Paleo	Early	9000 - 8400 BC	Gainey, Barnes, and Crowfield traditions; small bands; mobile hunters and gatherers and large territories; fluted projectiles.
	Late	8400 - 8000 BC	Holcomb, hi-Lo and Lanceolate biface traditions; continuing mobility; campsite/way-station sites; smaller territories are utilized; non-fluted projectiles.
Archaic	Early	8000 - 6000 BC	Side-notched, Corner-notched (e.g., Nettling, Thebes) and Bifurcate Base traditions; growing diversity of stone tool types; heavy woodworking tools appear (e.g., ground stone axes and chisels).
	Middle	6000 - 2500 BC	Stemmed (e.g., Kirk, Stanley/Neville), Brewerton side-and corner-notched traditions; reliance on local resources; populations increasing; more ritual activities; fully ground and polished tools; net-sinkers common; earliest copper tools.
	Late	2000 - 950 BC	Narrow Point (e.g., Lamoka), Broad Point (e.g., Genesee), and Small Point (e.g., Crawford Knoll) traditions; less mobility; use of fish-weirs; more formal cemeteries appear; stone pipes emerge; long-distance trade (marine shells and galena).
Woodland	Early	950 - 400 BC	Meadowood tradition; cord-roughened ceramics emerge; Meadowood cache blades and side-notched points; Bands of up to 35 people.

Period		Time Period (circa)	Characteristics
	Middle	400 BC - AD 500	Saugeen tradition; stamped ceramics appear; Saugeen projectile points; cobble spall scrapers; seasonal settlements and resource utilization; post holes, hearths, middens, cemeteries, and rectangular structures identified.
	Transitional	AD 550 - 900	Princess Point tradition; cord roughening, impressed lines, and punctate designs on pottery; adoption of maize horticulture at the western end of Lake Ontario; oval houses and 'incipient' longhouses; first palisades; villages with 75 people.
	early Late Woodland	AD 900 - 1300	Glen Meyer tradition; settled village-life based on agriculture; small villages (0.4 ha) with 75-200 people and 4-5 longhouses; semi-permanent settlements.
	middle Late Woodland	AD 1300 - 1400	Uren and Middleport traditions; classic longhouses emerge; larger villages (1.2 ha) with up to 600 people; more permanent settlements (30 years).
	late Late Woodland	AD 1400 - 1600	Pre-contact Neutral tradition; larger villages (1.7 ha); examples up to 5 ha with 2,500 people; extensive croplands; also, hamlets, cabins, camps, and cemeteries; potential tribal units; fur trade begins ca. 1580; European trade goods appear.

Research and previous archaeological assessments have demonstrated that the area around the Town of Caledon was intensively occupied by pre-contact Indigenous communities from the Paleo period up to the time of contact. The following subsections outline the cultural or temporal periods recognized for southern Ontario more generally.

2.1.1 Paleo Period

The Paleo Period represents a temporal classification developed by archaeologists and does not reflect any inferences of initial human habitation. Based on archaeological investigations, the first human occupation of southern Ontario begins just after the end of the Wisconsin Glacial Period. Although there were a complex series of ice retreats and advances which played a large role in shaping the local topography, southern Ontario was ice free by approximately 12,500 years ago.

The archaeological record has documented human settlement at 11,000 years ago, when the area was settled by Indigenous groups who had been living south of the Great Lakes. The period of these early inhabitants is known as the Paleo Period (Ellis and Deller 1990). The Paleo Period in Ontario is broadly characterized by many small groups of hunter-gatherers whose subsistence strategies followed a pattern of seasonal mobility over large areas, often travelling distances in excess of 150 km in an effort to procure raw materials for the production of lithic tools and the hunting of contemporary animals along migratory routes including caribou as well as mammoth and

mastodon. For example, groups in southern Ontario appear to have followed a seasonal round that extended from as far south as Chatham to the Horseshoe Valley north of Barrie.

The research suggests that population densities were very low during the Early Paleo Period, and, as such, archaeological examples of sites from this time are rare (Ellis and Deller 1990:54). The current understanding of Early Paleo locality is that sites tend to be situated in elevated topography on well-drained loamy soils with many of the known sites located on former beach ridges associated with glacial lakes. Many of the archaeologically investigated Paleo sites are relatively small in size compared to later periods and typically represent contemporary camp sites; however, there are large sites, such as the Parkhill and Fisher sites, identified as extending over several hectares. It is likely these larger sites were formed as people continued to occupy the same area for short durations over the course of several years. Given the placement of many sites on elevated locations, it has been suggested that they may represent communal hunting camps as they would likely have been advantageous to observe and intercept migratory mammals such as caribou (Ellis and Deller 1997). Other sites, such as smaller Early Paleo camps, were situated throughout the interior of Ontario were typically situated adjacent to wetlands.

Paleo Period sites are commonly recognized by the presence of distinctive, finely-crafted lance points. Knives, graters, scrapers and a variety of other stone processing tools are also typically associated with Paleo Period sites (MCR 1981). Diagnostic signatures of Early Paleo Period populations include the production of projectile points with channel flakes or flutes predominately manufactured from Collingwood or Onondaga chert. Paleo Period fluted points may be a reflection of large game hunting, while tools such as scrapers, piercing implements and graters that are typically associated with Paleo Period sites may have been used in the manufacture and repair of wooden implements, bone tools and clothing (Peers 1985).

By the Late Paleo Period (8400-8000 BC), enclosed coniferous forests with some minor deciduous elements became established in southern Ontario. It is likely that many of the large game species that had been hunted during the early epoch of the Paleo Period had either moved further north, or as in the case of the mastodons and mammoths, became extinct. Similar to the inhabitants during the Early Paleo Period, Late Paleo Period populations traversed large territories in response to seasonal resource fluctuations. The transition to the Late Paleo Period also included projectile points comprised of smaller unfluted projectiles along with lanceolate parallel flaked stemmed and non-stemmed Plano points, while hunting strategies may have transitioned from communal groups to more individualized pursuits (Ellis and Deller 1997).

2.1.2 Archaic Period

During the Early Archaic Period (8000-6000 BC), a gradual increase in atmospheric humidity in conjunction with warmer summers influenced the environmental landscape. Fossil pollen and spore identification from sedimentation cores lifted from Lovesick Lake provide evidence of climate change, with jack pine forests becoming dominant during the beginning of the Early Archaic Period (Teichroeb 2007).

Concurrent with the environmental evolution during the Early Archaic Period were notable diagnostic technological changes including the appearance of side and corner-notched projectile points. Other significant innovations included the introduction of ground stone tools such as celts and axes, which may reflect an emerging woodworking industry.

Populations in Ontario during this period primarily utilized maritime landscapes during the spring, summer and fall seasons with large base camps on islands, near river mouths, and on the shores of embayment's where a variety

of flora, fish, and wild fowl resources could be obtained. Smaller hunting and specialized campsites were also established in the uplands and along smaller watercourses.

During the Middle Archaic Period (6000 – 2000 BC) the environmental landscape continued to evolve with the jack pine forests prevalent during the Early Archaic Period being primarily replaced by white pine growth, suggesting a gradual increase in humidity and a continuation of hot summers (Teichroeb 2007).

The trend towards more diverse toolkits also continued into the Middle Archaic Period, as the presence of net-sinkers and fish weirs indicate that fishing was an important component of the subsistence strategy. Net-sinkers were typically used with both gill nets and seine nets, which were employed for both shoreline and offshore fishing activities. Gill nets were kept vertical with stone sinkers on the bottom and floats on the top and were often anchored to a specific location with the use of larger stones. Seine nets acted as fences and were used to corral and hold the fish and needed to be kept tight to the bottom of the water by attaching many closely spaced sinkers to the bottom of the net with floats attached to the top (Ingleman *et al* 2012; Prowse 2003). Many contemporary fishing nets were commonly made from hemp or nettle (Needs-Howarth 1999) and are rarely preserved in the archaeological record (Ingleman *et al* 2012).

The Middle Archaic also marks when bannerstones were first manufactured. Bannerstones are carefully crafted ground stone devices that served as a counterbalance for atlatls or spear-throwers. Another characteristic of the Middle Archaic is an increased reliance on local, sometimes lower-quality chert resources for the manufacturing of projectile points. During earlier periods, groups likely occupied large territories which may have increased access to a primary outcrop of high-quality chert during their seasonal round. However, during the Middle Archaic, groups who inhabited smaller territories may only have had access to lower quality materials which had been deposited by the glaciers in the local till and river gravels.

It was during the latter part of the Middle Archaic Period that long-distance trade routes began to develop, spanning the northeastern part of the continent. In particular, copper tools manufactured from a source located northwest of Lake Superior were being traded (Ellis, Kenyon and Spence 1990), with a wide range of copper tools such as socketed and tanged spear points, projectile points, harpoons, crescent knives, gouges, pikes and celts being produced during this period (Dawson 1983).

Trade networks established during the Middle Archaic Period also continued to flourish during the Late Archaic Period (2500-950 BC). Copper implements from northern Ontario and marine shell artifacts from the Mid-Atlantic coast have been frequently encountered in burial contexts (Ellis, Kenyon and Spence 1990; Ellis, Timmins and Martelle 2009).

During the Late Archaic the trend towards decreased territory size and a broadening subsistence base continued. In the archeological record, Late Archaic sites are more numerous than Early or Middle Archaic sites suggesting that populations were increasing. Regionalized variations during the Late Archaic Period are also reflected in projectile point manufacturing, with distinct locally diagnostic styles appearing. Other artifacts including polished stone pipes and banded slate gorgets also appear on Late Archaic Period sites, as well as "birdstones", which are small, bird-like effigies usually manufactured from green banded slate (Ellis, Kenyon and Spence 1990).

It is during the Late Archaic Period that defined cemeteries are identified. The appearance of burial pits during the Late Archaic Period has been interpreted as a possible response to increased population densities and competition between local groups for access to resources. It has been theorized that cemeteries and burial grounds may have provided strong symbolic claims over a local territory and the surrounding resources and are

often located within areas of elevated topography containing well-drained sandy and gravel soils adjacent to major watercourses. Burial sites reflect the importance of the landscape to Indigenous populations as they represent locations along travel routes that would be returned to, where feasts would occur, and the dead could be honoured (Taylor 2015).

2.1.3 Woodland Period

The Early Woodland Period (940 to 400 BC) is distinguished archaeologically from the Late Archaic Period primarily by the introduction of ceramic technology. The first pots were thick walled and friable, suggesting they may have primarily been used in the processing of nut oils by boiling crushed nut fragments in water and skimming off the oil (Spence, Pihl and Murphy 1990). These early vessels were not easily portable, and their fragile nature suggests they may have required regular replacement. There have also been numerous Early Woodland Period sites identified where ceramics were absent from the recovered assemblage, suggesting ceramic vessels may have not been completely integrated within the daily lives of Early Woodland Period populations.

Besides the addition of ceramic technology, the cultural affinity of Early Woodland Period inhabitants shows a great deal of continuity with the preceding Late Archaic Period. For instance, birdstones continued to be manufactured, although the Early Woodland Period varieties have "pop-eyes" that protrude from the sides of their heads (Spence, Pihl and Murphy 1990). Another example of general continuity from the terminal segment of the Archaic Period is represented by the thin, well-made projectile points, although the Early Woodland Period variants were side-notched rather than corner-notched, giving them a slightly altered and distinctive appearance (Spence, Pihl and Murphy 1990).

Evidence of exchange networks during the early stages of the Woodland Period indicate numerous reciprocal, down-the-line exchanges between trade partners located both short and long distances away. There is a gradual intensification of these types of trade throughout the period continuing into, and reaching its apex in, the Middle and Late Woodland Periods (Hartmann 1996). During the last 200 years of the Early Woodland Period, projectile points manufactured from high quality raw materials from the American Midwest begin to appear on sites in southwestern Ontario.

The Middle Woodland Period (300 BC to 500 AD) reflects an evolving transition from patterns observed from archaeological excavations documenting Archaic and Early Woodland Period sites. Middle Woodland peoples relied much more extensively on ceramic technology where vessels are often heavily decorated with impressed designs covering the entire exterior surface and upper portion of the vessel interior. Consequently, even very small fragments of Middle Woodland vessels are easily identifiable.

While Middle Woodland Period populations still relied on hunting and gathering to meet their subsistence requirements, an increased consumption of fish became an important dietary component. Some Middle Woodland Period sites have produced literally thousands of bones from spring spawning species including walleye and sucker (MCR 1981). Food sources such as shellfish, tree nuts and a proliferation of plant greens and seeds were also utilized during the Middle Woodland Period. The seasonal variety and relative dependability of these food sources encouraged population growth in many areas.

It is at the beginning of the Middle Woodland Period that rich, densely occupied sites appear along the margins of major rivers and lakes. While these areas had been utilized by earlier peoples, Middle Woodland sites are significantly different in that the same location was occupied off and on for as long as several hundred years and large deposits of artifacts often accumulated. The land use patterns reflected from archaeological investigations of

Middle Woodland Period sites generally reflect densely occupied locations that appear on the valley floor of major rivers, often producing sites with significant artifact deposits. Unlike earlier seasonally utilized locations, many Middle Woodland Period sites appear to have functioned as base camps, occupied periodically over the course of the year and situated to take advantage of the greatest number of resources. There are also numerous small upland Middle Woodland Period sites, many of which can be interpreted as special purpose camps where localized natural resources were utilized (MCR 1981).

The Late Woodland Period began with a shift in settlement and subsistence patterns involving an increasing reliance on corn horticulture (Fox 1990:185; Smith 1990; Williamson 1990:312). Corn may have been introduced into southwestern Ontario from the American Midwest as early as AD 600 or a few centuries before. However, corn did not become a dietary staple until at least three to four hundred years later, and then the cultivation of corn gradually spread into south-central and southeastern Ontario.

During the early Late Woodland, particularly within the Princess Point Complex (circa AD 500-1050), a number of archaeological material changes have been noted: the appearance of triangular projectile point styles, first seen during this period begin with the Levanna form; cord-wrapped stick decorated ceramics using the paddle and anvil forming technique replace the mainly coil-manufactured and dentate stamped and pseudo-scallop shell impressed ceramics; and if not appearance, increasing use of maize (*Zea mays*) as a food source (Bursey 1995; Crawford et al. 1997; Ferris and Spence 1995:103; Martin 2004 [2007]; Ritchie 1971:31-32; Spence et al. 1990; Williamson 1990:299). Aside from projectile points, Princess Point Complex assemblages are predominantly characterized by informal or expedient flake tools and ground stone and bone artifacts are rare (Ferris and Spence 1995:103; Shen 2000).

The Late Woodland Period is considered to coincide with the beginning of agricultural life ways in southern Ontario. Researchers have suggested that a warming trend during this time may have encouraged the spread of maize into this part of the province, providing a greater number of frost-free days (Stothers and Yarnell 1977). Further, shifts in the location of sites have also been identified with an emphasis on riverine, lacustrine and wetland occupations set against a more diffuse use of the landscape during the Middle Woodland (Dieterman 2001). These locations may have provided nutrient-rich soil for agriculture, while growing sedentism is seen as a departure from Middle Woodland hunting and gathering and may reflect growing investment in the care of garden plots of maize (Smith 1997:15).

The first agricultural villages documented in the archaeological record in southern Ontario have been dated to the 10th century. Unlike the riverine base camps of the Middle Woodland Period, these sites are located in upland locations on well-drained sandy soils. Identified archaeologically as "Early Late Woodland" (AD 900-1300), it is suggested that these early populations were ancestral to the Iroquoian groups which later inhabited southern Ontario at the time of first European contact.

Village sites dating between AD 900 and 1300 share many attributes with the historically investigated Iroquoian sites, including the presence of longhouses and sometimes palisades. These early longhouses averaged 12.4 m in length (Dodd et al. 1990:349; Williamson 1990:304-305). It is also quite common to find the outlines of overlapping house structures, suggesting that these villages were occupied long enough to necessitate re-building. The Jesuits reported that the Huron moved their villages once every 10-15 years, when the nearby soils had been depleted by farming and conveniently collected firewood grew scarce (Pearce 2018). It seems likely that Early Late Woodland peoples lived in villages for considerably longer, as they relied less heavily on corn than did later groups, and their villages were much smaller, placing less demand on nearby resources.

Judging by the presence of carbonized corn kernels and cob fragments recovered from sub-floor storage pits, agriculture was becoming a vital part of the early Late Woodland economy. However, it had not reached the level of importance it would during the middle Late and late Late Woodland Periods. There is ample evidence to suggest that more traditional resources continued to be utilized and comprised a large part of the subsistence economy. Seasonally occupied special purpose sites relating to deer procurement, nut collection, and fishing activities, have all been identified. While beans are known to have been cultivated later in the Late Woodland Period, they have yet to be identified on early Late Woodland sites.

The middle Late Woodland Period (AD 1300-1400) witnessed several interesting developments in terms of settlement patterns and artifact assemblages. Changes in ceramic styles have been carefully documented, allowing the placement of sites in the first or second half of this 100-year period. Moreover, villages, which averaged approximately 0.6 hectares in extent during the early Late Woodland, now consistently range between one and two hectares.

House lengths also change dramatically, more than doubling to an average of 30 m, while houses of up to 45 m have been documented. This increase in longhouse length has been variously interpreted. The simplest possibility is that increased house length is the result of a gradual, natural increase in population (Dodd et al. 1990:323, 350, 357; Smith 1990). However, this does not account for the sudden shift in longhouse lengths around AD 1300. Other possible explanations involve changes in economic and socio-political organization (Dodd et al. 1990:357). One suggestion is that during the middle Late Woodland Period small villages were amalgamating to form larger communities for mutual defense (Dodd et al. 1990:357). If this was the case, the more successful military leaders may have been able to absorb some of the smaller family groups into their households, thereby requiring longer structures. This hypothesis draws support from the fact that some sites had up to seven rows of palisades, indicating at least an occasional need for strong defensive measures. There are, however, other middle Late Woodland villages which had no palisades present (Dodd et al. 1990). More research is required to evaluate these competing interpretations.

The lay-out of houses within villages also changes dramatically by AD 1300. During the early Late Woodland Period villages were planned with houses oriented in various directions. During the middle Late Woodland Period villages are organized into two or more discrete groups of tightly spaced, parallel aligned, longhouses. It has been suggested that this change in village organization may indicate the initial development of the clans which were a characteristic of the historically known Iroquoian peoples (Dodd et al. 1990:358).

Initially at least, the Late Woodland Period (AD 1400-1650) continues many of the trends which have been documented for the preceding century. For instance, between AD 1400 and 1450 house lengths continue to grow, reaching an average length of 62 m. One longhouse excavated on a site southwest of Kitchener was an incredible 123 m (Lennox and Fitzgerald 1990:444-445). After AD 1450, house lengths begin to decrease, with houses dating between AD 1500 and 1580 averaging 30 m in length.

As to why house lengths decrease after AD 1450 is still being investigated, though it is understood that the shorter houses witnessed on Historical Period sites can be at least partially attributed to the population reductions associated with the introduction of European diseases such as smallpox (Lennox and Fitzgerald 1990:405, 410).

Village size also continues to expand throughout the Late Woodland Period, with many of the larger villages showing signs of periodic expansions. The middle Late Woodland Period and the first century of the late Late Woodland Period was a time of village amalgamation. One large village situated just north of Toronto has been shown to have expanded on no fewer than five occasions. These large villages were often heavily defended with

numerous rows of wooden palisades, suggesting that defence may have been one of the rationales for smaller groups banding together. A pattern of Late Woodland village expansion has been clearly documented at several sites throughout southwestern and south-central Ontario (Anderson 2009).

Not all First Nations within southern Ontario resided within villages during the Late Woodland Period, as some communities continued to live in areas along waterways during the summer months and inland hunting sites during the winter.

Early contact with European settlers at the end of the Late Woodland Period resulted in changes to the traditional lifestyles of most Indigenous populations inhabiting Ontario including settlement size, population distribution, and material culture. The introduction of European-borne diseases significantly increased mortality rates, resulting in a drastic decrease in population size (Warrick 2000).

2.2 Post-Contact Indigenous Occupation of Southern Ontario

The post-contact Indigenous occupation of southern Ontario was heavily influenced by the dispersal of various Iroquoian-speaking peoples by the nations of the Haudenosaunee Confederacy, and the subsequent arrival of Algonkian-speaking groups from northern Ontario at the end of the 17th century and beginning of the 18th century (Schmalz 1991).

Following the introduction of Europeans to North America, the nature of Indigenous settlement size, population distribution, and material culture shifted as settlers began to colonize the land. Despite this shift, “written accounts of material life and livelihood, the correlation of historically recovered villages to their archaeological manifestations, and the similarities of those sites to more ancient sites have revealed an antiquity to documented cultural expressions that confirms a deep historical continuity to Indigenous systems of ideology and thought” (Ferris 2009:114). As a result, Indigenous peoples of southern Ontario have left behind archaeologically significant resources that show continuity with past peoples, even if this connection has not been recorded in historical Euro-Canadian documentation.

During the late 1600s and early 1700s, French explorers and missionaries reported a large population of Iroquoian peoples clustered around the western end of Lake Ontario. The part of this area that is now referred to as the Peel Region was known to have been populated by the ancestors of two Late Woodland groups who would become historically referred to as the Neutral (Attawandaron) and Huron nations.

2.3 Historical Euro-Canadian Period

2.3.1 Township of Caledon, County of Peel

The Study Area is located within part of the Mississauga Tract which was ceded to the British by the Mississaugas on the 28th of October 1818, under Treaty 19, for £522 and 10 shillings annually. Treaty 19 was the “Second Purchase” involving the Tract of which the “First Purchase” or “Mississauga Purchase” of 1805 allowed the British Crown to acquire over 74,000 acres of land in southern Peel County. Treaty 19 transferred an additional 648,000 acres of the Tract to the British who in 1819 surveyed the area and divided it into the townships of Toronto, Chinguacousy, Caledon, Albion and Toronto Gore (PAMA 2014).

Albion, Caledon and Chinguacousy Townships began settlement in 1820 with Caledon and Chinguacousy consisting of six concessions on both the east and west sides of Centre Road. According to George Walton’s 1842 *Walton’s Home District Directory*, the population of Caledon Township that year was 1,920. The 1870s saw the creation of railway lines east of the study area for the Credit Valley Railway (CVR) and Toronto Grey & Bruce

Railway (both acquired by the Canadian Pacific Railway [CPR] in 1884). Caledon Township was bound on the east by Albion Township, on the south by Chinguacousy Township, on the west by Erin Township in the County of Wellington, and on the north-west by Garafraxa Township also in the County of Wellington (Lynch 1874).

Events in Europe during the mid-19th century dramatically improved the fortunes for Caledon Township and the surrounding county. A combination of failed harvests and disrupted trade routes caused by the Crimean War suddenly created a market for Canadian wheat producers, then centred in Ontario, to meet global demand. Simultaneously, the 1854 Canadian American Reciprocity Treaty prompted farmers to also take up livestock rearing for export to the United States (Scheinman 2009). Getting these products to consumers was aided by the new railway lines.

At the opening of the 20th century, economic development in Caledon Township, like that of adjacent counties and townships, relied on the prosperity of nearby Toronto and exports to the United States and Britain. Following World War II, the widespread use of motor vehicles brought changes to urban and rural development. As vehicular traffic increased, the network of roadways throughout the region improved, providing Caledon Township and its communities with better connections to the growing metropolis of Toronto.

Significant new growth and development has occurred in Peel County over the past four decades. When it became the Regional Municipality of Peel in 1974, Caledon Township along with Albion Township and the north half of Chinguacousy Township were incorporated into the new Town of Caledon. In that year, there were 334,750 people living in Peel Region and by 2014 the population numbered 1,350,000 (Neill 2015). The 2016 census recorded Peel's population at 1,381,739, of which 66,502 were residents of Caledon.

2.3.2 Study Area Specific Context

Though Location 1 (AkHa-23) is located exclusively within Part of Lot 15, Concession 4 WSCR, all lots within the Study Area are initially discussed below to aid in a comprehensive overview of the history of the lands surrounding the site. This is followed by a discussion of Lot 15, Concession 4 WSCR more specifically.

A review of historical county maps, topographic maps, and aerial imagery chart the 19th and 20th century development of the Study Area. The earliest cartographic resource consulted was George Tremaine's 1859 *Tremaine's Map of the County of Peel, Canada West* (Tremaine 1859) (Map 3). This map suggests the alignments for present-day Main Street and Mississauga Road are nearly identical to the original concession roads at that time. The 1859 map also depicts the Credit River east of the Study Area and branches of the Credit River flowing adjacent to the north portion of the Study Area (Map 3).

At the northeast end of the Study Area, the 1859 map portrays the "Coulter Estate" while near the south end of the Study Area, the village of "Church's Falls" is visible. These appear to be the predecessors of the present-day communities of Coulterville and Cataract, respectively. Furthermore, two structures (likely farmhouses) are illustrated within the Study Area on the 1859 map (Map 3). The northwestern-most farmhouse is within the property of Duncan Cameron (Lot 17, Concession 4 WSCR) and appears to be situated in the same location as the present-day house at 18667 Mississauga Road. The southernmost farmhouse is within the property of James Cameron (Lot 16, Concession 4 WSCR) and appears to be situated in the same location as the present-day house at 18501 Mississauga Road.

Nearly two decades later, J.H. Pope's 1877 *Illustrated Historical Atlas of the County of Peel* (Pope 1877) depicts the Lot 16 side road as similar to the present-day alignment for Charleston Sideroad. Furthermore, the Credit River and its branches are portrayed as traversing similar paths to those of 1859 and the Coulterville Estate

remains at the northeast end of the Study Area. Notable changes include the renaming of the village of Church's Falls (near the south end of the Study Area) to "Cataract" and the establishment of the CVR along the northeast perimeter of the Study Area (Map 3).

The 1877 map still illustrates the same two farmhouses shown in the 1859 map but also presents orchards adjacent to each structure. In addition to these two farmhouses, five new (or newly illustrated) individual structures are depicted in the Study Area on the 1877 map. The new individual structures include four labeled "residences" (farmhouses) and one "school house" as depicted in the 1877 map (Map 3).

From north to south, the first new farmhouse as well as the schoolhouse are located in Lot 16, Concession 3 WSCR, as part of the Coulter Estate, while the second new farmhouse is located in the east corner of Lot 16, Concession 4 WSCR, still listed as the property of James Cameron and situated near the location of the present-day house at 1420 Charleston Sideroad. The third new farmhouse also has an accompanying orchard and is located in the northeast half of Lot 15, Concession 4 WSCR, listed as the property of Thomas McNicholl, while the fourth new farmhouse is located in the southwest half of the same lot, listed as part of the Morris Estate and situated in the same location as the present-day remnants/ foundation at 1055 Charleston Sideroad (Map 3).

Available topographic maps and aerial images document the evolution of the Study Area during the 20th century. The 1937 and 1952 versions of the *Topographic Map, Ontario – Orangeville Sheet* by the Department of National Defence (Ontario Council of University Libraries [OCUL] n.d.) provide a more accurate representation of the waterbodies in the Study Area and suggest that branches of the Credit River flow through the west portion of the Study Area as well as to the east of the Study Area. The 1937 and 1952 maps also suggest that six of the seven farmhouses portrayed within the Study Area in 1877 (or versions of them) were still extant and, furthermore, were accompanied by associated barns and/ or outbuildings (Map 4). While the farmhouse on the former Coulter Estate appears to have been replaced with a structure closer to the Lot 16 side road, the schoolhouse on the former property is still illustrated and appears to be situated in the same location as the present-day house at 1626 Charleston Sideroad, just outside of the current Study Area. Another notable change from the 1877 map is the conversion of the former CVR to the CPR (a transition that occurred in 1884, see Section 1.2.3.1) (Map 4).

A 1954 aerial photograph by the Department of Lands and Forests (McMaster University Library 2023) presents the Study Area as identical to the previous topographic maps and confirms the majority of the Study Area remained rural agricultural land with tracts of woodlots interspersed throughout (Map 5). While the number of outbuildings/ barns have changed for the several farmhouses illustrated in the 1877, 1937 and 1952 maps, the main houses still appear to be extant within the Study Area on the 1973 map. Furthermore, Charleston Sideroad appears to have been modified to its present-day alignment and the CPR line remains visible on the 1973 map (Map 5). Though northern portions of the CPR line were decommissioned by 1996, the Brampton-Orangeville Railway was created in 2000 and has been operating freight traffic and a tour train on the line from Streetsville to Orangeville maintaining the use of the rail corridor near the Study Area to the present-day (Town of Caledon 2009).

2.3.2.1 Lot 15, Concession 4 WSCR

Lot 15, Concession 4 WSCR was originally wooded with maple, elm, beech, and bass, and the soil was a black loam (PAMA n.d., Reel 08, 0665). The patent for the 200-acre Lot 15 was granted to Joseph Brown Jr. in 1822 as a United Empire Loyalist (U.E.L.) land grant (Ontario Land Registry, n.d.(a): 306). Joseph Jr. was one of five children (four sons and one daughter) of Joseph Brown, a U.E.L. who served in Butler's Rangers during the Revolutionary War and moved to Grantham Township, Lincoln County, Canada in 1784. All five of Joseph's

children located their U.E.L. grants in Caledon West and were among the pioneers of the township (PAMA n.d., Reel 08, 0691).

Joseph Jr. and his wife sold the entirety of the lot in June 1847 to Solomon John Johnson Brown for £125; the relationship between these parties could not be definitively established. As of the 1851 Census, Solomon J. J. Brown (25) was resident in Niagara Township with his parents Joseph and Almira Brown, and five siblings, including a brother Henry J. (23) (1851 Personal Census, District 2, Caledon: 145). In March 1859, Solomon Brown transferred the east half of Lot 15 to Henry James Brown, likely his brother, by indenture of \$550. Tremaine's 1859 *Map of the County of Peel* shows the entire Lot 15 owned by the Estate of Jos. Brown, deceased, and no structures on the property (Tremaine 1859, Map 3).

The Brown-family owners of Lot 15 do not appear in the census records for Caledon Township. The 1861 Agricultural census shows the Lot in the use of two farmers, James McBrien, and Thomas McGoldrick. McBrien is listed as holder of 100 acres on Lot 15, with 35 under cultivation (26 wheat, 1 potatoes, and 8 pasture); McGoldrick is also listed as holder of 100 acres, with 40 under cultivation (20 wheat, 1 peas, 2 oats, 1 turnip, 1 potatoes, and 10 pasture). The estimated value of each hundred is \$1000 (1861 Agricultural Census, District 6, Caledon: 86). It is likely that Thomas McGoldrick was farming the east half of the lot, as he purchased that hundred from Henry James Brown and his wife for \$1000 in March 1862. In the same month, Solomon J. J. Brown and his wife sold the west half of Lot 15 to Joseph Morris for \$1000 (Ontario Land Registry, n.d.(a): 306).

The 1861 Census shows Thomas McGoldrick (30) living with his wife Mary (23) and three children, Margaret (7), Ann (5), and Emily (3) (1861 Personal Census, District 6, Caledon: 76). Thomas was already farming the east part of Lot 15 in 1861, but after acquiring the land for \$1000 in 1862, the McGoldricks immediately sold the northeast quarter to Thomas McNickles [sic, McNichol] for \$1000. The McGoldricks retained ownership of the west 50 acres and took out two mortgages on the land; the first was to James Cameron for \$300 in December 1862, the second to John Ferris for \$200 in July 1864. The land was transferred by indenture three times in 1866 to 1867. The first transfer was from the McGoldricks to John Coyne in March 1866 for \$200. The second was from Coyne to James Cameron for only \$50 in February 1867; likely this price was the net of mortgage funds owing. The third transfer was from James Cameron to Thomas McNichol, the owner of the northeast quarter, in March 1867 for \$850 (Ontario Land Registry, n.d.(b): 431).

The 1871 Census shows Thomas McNichol (26), a farmer, living with Benson McNichol (22), and Robert McNichol (20), a clerk (1871 Census, Schedule 1, District 40/A, Caledon No.4: 44). The McNichols were Presbyterian and of Irish ancestry. Thomas McNichol is listed as the owner of 100 acres at Lot 15, Concession 4, with one house, and one barn (1871 Census., Schedule 3: 8). He owned a total of 230 acres, of which 120 were identified as improved, including 30 acres of wheat, 1 potatoes, 30 of hay, 5 pasture, and 1 acre of orchard (1871 Census., Schedule 4: 8). Other assets and products of the farm included 2 horses, 2 colts/fillies, 2 working oxen, and 6 other horned cattle (1871 Census., Schedule 5: 8).

J.H. Pope's 1877 *Illustrated Historical Atlas of the County of Peel* shows Thomas McNichol as the owner of the east half of Lot 15, Con. 4 WSCR. (Walker and Miles 1877, Map 3). One structure is shown on the property in the northwest quadrant, accessed from the third concession road to the northeast; the orchards on the property are shown to the west of the house. The 1881 Census shows Thomas (38) living with his wife Ann (Dodds) (34), and three children, George (9), Leslie (5), and Jennie (3 mos.) (1881 Census, Schedule 1, Cardwell 141, Caledon No.1: 30). The family was still living together at the time of the 1891 Census, with the addition of a fourth child, Sarah (2) (1891 Census, Schedule 1, Cardwell 54/D, Caledon: 81). The 1897 Tax Assessment shows Thomas

McNichol, age 50, as owner of 100 acres at Lot 15, Con. 4, with 85 acres cleared, and an assessed value of \$3400 (PAMA 1897, Division 7: 43).

Ann McNichol died in 1904, the same year as the death of their second child, Leslie (Find a Grave 2022). Thomas continued to own the east 100-acres of Lot 15 until he sold the land in January 1912 to John A. McEachern for \$9100 (Ontario Land Registry, n.d.(b): 431).

3.0 ARCHAEOLOGICAL CONTEXT

3.1 Existing Conditions

The Study Area is located in a rural part of the Town of Caledon, generally bounded by Mississauga Road to the south, the CP Railway to the north, the western edge of Lot 14, Concession 4 WSCR to the east, and the eastern edge of Lot 18, Concession 4 WSCR to the west. Charleston Sideroad, or Highway 24, is a northeast-southwest road that bisects the Study Area, with approximately two thirds north of the highway and one third to the south. The Study Area is comprised of active agricultural lands, wooded areas, overgrown farmland, including pasture and meadows, as well as residential lots and farm complexes. The Study Area is surrounded by farmland and wooded areas to the south and west, the TPC Toronto at Osprey Valley Golf Course to the north, and the hamlet of Cataract and Forks of the Credit Provincial Park to the east.

Location 1 (AkHa-23) is situated in the eastern portion of the Study Area within a former residential lot and the agricultural field to the northeast (Supplementary Documentation; Map SD1).

3.2 Physiography

The Study Area is situated entirely within the “Guelph Drumlin Field” physiographic region (Chapman and Putnam 1984:137).

The drumlins of this field are not so closely grouped as those of some other areas and there is more intervening low ground, which is largely occupied by fluvial materials. The till in these drumlins is loamy and calcareous, and was derived mostly from dolostone of the Amabel Formation so strategically exposed along the Niagara Cuesta...The till throughout is rather stony, with large surface boulders being more numerous in some localities than others...The ice which moulded this drumlin field advanced from the southeast and the front of the melting receding glacier was at right angles to this, that is, down slope of the plain. The drainage of the ice front was consequently able to find progressively lower and lower outlets, so that the drumlin field is furrowed by more or less parallel valleys running almost at right angles to the trend of the drumlins themselves. There are also numerous interconnecting cross valleys which occupy deeper depressions between drumlins. Along the sides of these valleys there are broad sand and gravel terraces, while the bottoms are often swampy...Incidental to this pattern are the several gravel ridges or eskers which cross the plain in the same general direction as the drumlins.

(Chapman and Putnam 1984:137-138)

The localized topography of the Study Area is generally flat and is approximately 390 to 420 m above sea level. The soils of the Study Area are comprised primarily of Dumfries Loam and Caledon Loam, with a small section of Gilford loam at the western extent. Dumfries soils consist of well drained dark gray-brown loam or sandy loam with a high stone content, commonly used for cultivation of cereal grains, legumes, hay and pasture (Hoffman and Richards 1953). Caledon and Gilford soils both occur as gravelly outwash plains, but Caledon Loam is the well drained member, whereas Gilford Loam is the poorly drained member. Caledon soils consist of very dark grey-brown loam and are used for the cultivation of cereal grains, hay and pasture. Gilford soils consist of very dark grey loam and are primarily used for pastures and woodlots. These three soils tend to require additional fertilizer to maintain adequate organic matter levels, as well as mitigating the hazards of erosion and large stones to cultivation practices (Hoffman and Richards 1953).

The soil within Location 1 (AkHa-23) consisted of Dumfries loam with moderate compaction and 5-25% stone content.

The closest potable water source is the Credit River, which flows approximately 1 km southeast of the site. The Credit River Watershed spans 1,000 km² and drains into Lake Ontario at the Port Credit, Mississauga waterfront (Credit Valley Conservation 2022).

The bedrock deposits in the vicinity date to the Middle and Lower Silurian Periods and consist of the Lockport-Amabel Formation (Hewitt 1972). The Guelph-Lockport Dolomites form the cap of the Niagara Escarpment, outcropping from Niagara Falls through Dundas and Guelph up to the Bruce Peninsula. The Lockport Dolomites consists of three members: Gasport Dolomitic Limestone, Goat Island Dolomite and Eramosa Dolomite. Similarly, the Amabel Formation also consists of three members, including: a finer crystalline blocky dolomite named Lions Head Member, a fine to medium crystalline dolomite named Warton Member, and a brown, thin-bedded fine crystalline dolomite named Eramosa Member (Hewitt 1972).

The Study Area lies within the Mixed-wood Plains ecozone of Ontario (The Canadian Atlas Online 2015). Although largely altered by recent human activity, this ecozone once supported a wide variety of deciduous trees, such as various species of ash, birch, chestnut, hickory, oak, and walnut, as well as a variety of birds and small to large land mammals, such as raccoon, red fox, white tailed deer, and black bear.

3.3 Registered Archaeological Sites

To compile an inventory of previously documented archaeological resources, the registered archaeological site records maintained by the MCM in the Ontario Archaeological Site Database (OASD) were consulted.

A total of six registered archaeological sites are located within 1 km of Location 1 (AkHa-23) and all these sites are situated within the current Study Area. The Cameron Site (AlHa-9) is the only site located within 300 m of Location 1 (AkHa-23). Section 3.1.4.2 below provides further details on the registered sites identified during the Stage 1 and 2 AA of the Study Area.

Table 2: Registered archaeological sites within 1 km of Location 1 (AkHa-23)

Borden Number	Site Name	Affinity	Site Type
AlHa-9*	Cameron	Post-Contact	homestead, house
AlHa-52	Location 15	Post-Contact	midden
AkHa-33	Location 26	Pre-Contact Indigenous	scatter
AkHa-29	Location 12	Post-Contact	midden
AkHa-28	Location 10	Pre-Contact Indigenous; Early Archaic	findspot
AkHa-27	Location 9	Post-Contact	midden

* denotes sites located within 300 m

3.4 Previous Archaeological Assessments

Per Section 1.1., Standard 1 of the MCM (Government of Ontario 2011), previous archaeological assessments undertaken within the limits of the Study Area or within 50 m of the Study Area were reviewed. To WSP's

knowledge, one previous archaeological assessment has been documented within the 50 m threshold and two previous archaeological assessments have been documented for the current Study Area.

3.4.1 Previous Assessments within 50 m of the Study Area

In 2017, Archaeological Research Associates Ltd. (ARA) conducted a Stage 1 and 2 Archaeological Assessment of a study area approximately 0.51 ha in size to satisfy Infrastructure Ontario's due diligence requirements in advance of the planned disposition of the property. The study area for this assessment is adjacent to Charleston Sideroad to the north and is located centrally between portions of the current Study Area. The Stage 1 identified areas of archaeological potential and areas of previous disturbance, and the Stage 2 consisted of test pit survey at 5 m intervals that did not result in the identification of any archaeological locations. No further work was recommended for this property (ARA 2017).

3.4.2 Previous Assessments of the Study Area

In 2001, Archaeological Assessments Ltd. conducted a Stage 1 and 2 Archaeological Assessment within the limits of the current Study Area, on part of the eastern halves of Lots 16, 17, and 18, Concession 4 WSCR, in advance of the proposed Osprey Valley West Golf Course. The size of the study area was approximately 89 ha, of which 69 ha was cultivated agricultural lands assessed by pedestrian survey at 5 m intervals, and 20 ha was mixed scrub and woodland assessed by test pit survey at 10 m intervals (Archaeological Assessments Ltd. 2001).

The Stage 1 and 2 assessment resulted in the identification of three archaeological locations, two pre-contact Indigenous findspots and one historical Euro-Canadian homestead, registered as the Cameron Site (AIHa-9). The first pre-contact Indigenous findspot consisted of a bifacially worked scraper and the second consisted of a large, finished biface, both manufactured on Onondaga chert. These two findspots were judged to have low cultural heritage value or interest, and no further archaeological assessments were recommended for either location (Archaeological Assessments Ltd. 2001).

The Cameron Site (AIHa-9) was identified during the pedestrian survey of a ploughed agricultural field, located in the northeastern portion of the east half of Lot 16, Concession 4 WSCR. The site measured approximately 27 m north-south by 75 m east-west and produced a total of 66 historical Euro-Canadian artifacts, primarily household ceramics and glass. The Cameron Site (AIHa-9) was interpreted as a mid-19th century Euro-Canadian homestead occupied by the Cameron family until the early to mid-20th century. Historical archival research indicates that James Cameron occupied the site from the 1850s to 1870s, while the *1877 Historical Atlas Map of Caledon Township* (Map 3) indicates a structure in the northeastern corner of Lot 16 that corresponds to the same location as the Cameron Site (AIHa-9). As such, the Cameron Site (AIHa-9) was determined to have further cultural heritage value and interest and was recommended for Stage 4 mitigation if avoidance and protection was not possible (Archaeological Assessments Ltd. 2001).

Golder (now WSP) completed the Stage 1 and 2 AA for the current Study Area in the fall of 2020, and spring and summer of 2021 (Golder 2022). The results of the Stage 1 assessment identified archaeological potential within the Study Area for both pre-contact Indigenous and historical Euro-Canadian sites. This determination is based on the presence of well-drained soils, proximity to water sources such as the Credit River, as well as the proximity to registered archaeological sites (e.g., Cameron Site (AIHa-9) found in 2001) and areas of Euro-Canadian settlement dating back to the mid-19th century. Areas of archaeological potential within the Study Area were subject to survey during the Stage 2 AA through a combination of shovel test pit survey and pedestrian survey at 5 m intervals. The Stage 2 assessment resulted in the identification of 29 artifact producing locations, of which 18 are pre-contact Indigenous sites or findspots and 11 are historical Euro-Canadian sites. Of the 29 archaeological

producing locations, a total of 15 (Locations 3, 5, 6, 8, 11, 14, 19, 20, 21, 23, 24, 25, and 28) consisted of either a small amount of historical material or a single piece of lithic debitage, biface or scraper. Given the isolated nature of the finds, these locations were concluded to have no further CHVI as the sites do not meet the criteria identified in Section 2.2, Standards 1a-c, of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for determining the need for Stage 3 AA. Similarly, Location 29 was interpreted to be an isolated, intermixed deposit of historical and modern material, mostly consisting of wire-drawn and machine cut nails, and, as such, was considered sufficiently documented with no further CHVI. The remaining 13 sites (Locations 1, 2, 4, 7, 9, 10, 12, 15, 16, 18, 22, 26, and 27) were registered with the MCM, under the Borden system, in accordance with Section 7.12, Standards 1.a. and 1.c. of the MCM (2011) and will be discussed in further detail below.

Location 1 (AkHa-23), the site to which this report pertains, consisted of 1,561 historical Euro-Canadian artifacts, 69 faunal elements, and one piece of lithic debitage, recovered from 35 positive test pits, one 1 m² test unit, and 55 CSP points in an area measuring approximately 80 m by 75 m. Given that there are at least 20 artifacts that date Location 1 (AkHa-23) to before 1900, and the fact that the location of the site has been occupied since the mid- to late 19th century and may be associated with a nearby former structure and orchard on historical mapping, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA. The single pre-contact Indigenous artifact was concluded to have no further CHVI as it did not meet the criteria Section 2.2, Standards 1a or b of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for recommending Stage 3 AA.

Location 2 (AkHa-24) consisted of 220 historical Euro-Canadian artifacts and 15 faunal elements, recovered from 26 positive test pits and 65 CSP points in an area measuring approximately 90 m by 60 m. Given that there are at least 20 artifacts that date Location 2 (AkHa-24) to before 1900, and the fact that the location of the site has been occupied since the mid- to late 19th century and can be tied to a structure on historical mapping, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA.

Location 4 (AkHa-25) consisted of 32 historical Euro-Canadian artifacts and five faunal elements, recovered from recovered from 19 positive test pits in an area measuring approximately 45 m by 35 m. Given that there are at least 20 artifacts that date Location 4 (AkHa-25) to before 1900, and the fact that the location of the site has been occupied since the mid-19th century and can be tied to a nearby structure on historical mapping, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA.

Location 7 (AkHa-26) consisted of 248 historical Euro-Canadian artifacts and six faunal elements, recovered from recovered from 53 positive test pits in an area measuring approximately 70 m by 60 m. Given that there are at least 20 artifacts that date Location 7 (AkHa-26) to before 1900, and the fact that the location of the site has been occupied since the mid-19th century and can be tied to a nearby structure on historical mapping, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA.

Location 9 (AkHa-27) consisted of 44 historical Euro-Canadian artifacts recovered from an area measuring approximately 35 m by 45 m. Given that there are at least 20 artifacts that date Location 9 (AkHa-27) to before

1900, and the fact that the location of the site has been occupied since the mid- to late 19th century, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA.

Location 10 (AkHa-28) consists of single Early Archaic Nettling projectile point (8000 - 6000 BC) (OAS 1980), manufactured on Haldimand chert. As Location 10 (AkHa-28) met the criteria identified in Section 2.2, Standard 1a and b of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for recommending Stage 3 AA, it is concluded to have further CHVI.

Location 12 (AkHa-29) consisted of 40 historical Euro-Canadian artifacts recovered from an area measuring approximately 35 m by 35 m. Given that there are at least 20 artifacts that date Location 12 (AkHa-29) to before 1900, and the fact that the location of the site has been occupied since the mid to late 19th century, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA.

Location 15 (AlHa-52) consisted of 208 historical Euro-Canadian artifacts and one faunal element, recovered from an area measuring approximately 45 m by 50 m. Given that there are at least 20 artifacts that date Location 15 (AlHa-52) to before 1900, and the fact that the location of the site has been occupied since the mid- to late 19th century, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA.

Location 16 (AkHa-30) consisted of nine pieces of lithic debitage recovered over an area measuring approximately 20 m by 25 m. As Location 16 (AkHa-30) met the criteria identified in Section 2.2, Standard 1a of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for recommending Stage 3 AA, it is concluded to have further CHVI.

Location 18 (AkHa-31) consisted of 771 historical Euro-Canadian artifacts, 69 faunal elements, and one piece of lithic debitage, recovered from 80 positive test pits and 100 CSP points in an area measuring approximately 95 m by 85 m. Given that there are at least 20 artifacts that date Location 18 (AkHa-31) to before 1900, and the fact that the location of the site has been occupied since the mid to late 19th century and can be tied to a structure and orchard on historical mapping, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having cultural heritage value or interest (CHVI) and was therefore required to undergo Stage 3 AA. The single pre-contact Indigenous artifact is concluded to have no further CHVI as it does not meet the criteria Section 2.2, Standards 1a or b of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for recommending Stage 3 site-specific assessment.

Location 22 (AkHa-32) consisted of 20 pre-contact Indigenous artifacts including 17 pieces of lithic debitage, two projectile points, and one utilized flake, recovered from an area measuring 20 m by 25 m. As Location 22 (AkHa-32) met the criteria identified in Section 2.2, Standard 1a of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for requiring Stage 3 AA, it was concluded to have further CHVI.

Location 26 (AkHa-33) consisted of five pieces of lithic debitage recovered over an area measuring 5 m by 5 m. As Location 26 (AkHa-33) met the criteria identified in Section 2.2, Standard 1a of the *Standards and Guidelines*

for *Consultant Archaeologists* (Government of Ontario 2011) for recommending Stage 3 AA, it is concluded to have further CHVI.

Location 27 (AkHa-34) includes 109 historical Euro-Canadian artifacts and nine faunal elements, recovered from 19 positive test pits across an area measuring approximately 40 m by 30 m. Given that there are at least 20 artifacts that date Location 27 (AkHa-34) to before 1900, and the fact that the location of the site has been occupied since the mid- to late 19th century and can be tied to a structure on historical mapping, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA.

The re-established Cameron Site (AlHa-9) consisted of 66 historical Euro-Canadian artifacts recovered over an area measuring approximately 27 m north-south by 75 m east-west. Given that there are at least 20 artifacts that date the Cameron Site (AlHa-9) to before 1900, and the fact that the location of the site has been occupied since the mid- to late 19th century and can be tied to a structure on historical mapping, the site met the criteria identified in Section 2.2, Standard 1c and Table 3.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for having CHVI and was therefore recommended to undergo Stage 3 AA.

Based on the Stage 1 and 2 AA results, the following recommendations were provided (Golder 2022):

- 1) *Euro-Canadian sites, including Location 1 (AkHa-23), Location 2 (AkHa-24), Location 4 (AkHa-25), Location 7 (AkHa-26), Location 9 (AkHa-27), Location 12 (AkHa-29), Location 15 (AlHa-52), Location 18 (AkHa-31), Location 27 (AkHa-34), and the Cameron Site (AlHa-9) should be subject to Stage 3 Archaeological Assessment prior to any intrusive activity. The assessments should include researching all historical documentation sources listed Section 3.1 of the Standards and Guidelines for Consultant Archaeologists (Government of Ontario 2011), as well as any additional relevant sources. Research should also incorporate available historical and municipal information for existing heritage structures or architectural remains that may be related to the archaeological site. Subsequent Stage 3 Archaeological Assessment fieldwork should begin with a controlled surface pick-up (CSP), if applicable, and if not previously done as part of the Stage 2 survey. With the exception of the Cameron Site (AlHa-9), all other Euro-Canadian sites requiring Stage 3 Archaeological Assessment were subject to a CSP as part of the Stage 2 survey. Stage 3 test unit excavation at each Euro-Canadian site should begin by following the standards for Rural Historical Farmsteads as outlined in the MTCS's bulletin 19th Century Rural Historical Farmstead Sites (MHSTCI 2021) and **Section 3.2.3 and Table 3.1, Standards 3-4**, of the Standards and Guidelines for Consultant Archaeologists (Government of Ontario 2011). All fieldwork for the Stage 3 Archaeological Assessments should be completed in accordance with the Standards and Guidelines for Consultant Archaeologists (Government of Ontario 2011).*
- 2) *Pre-contact Indigenous sites, including Location 10 (AkHa-28), Location 16 (AkHa-30), Location 22 (AkHa-32), and Location 26 (AkHa-33) should be subject to Stage 3 Archaeological Assessment prior to any intrusive activity. The assessments should consist of the hand excavation of 1 m² test units that are placed across the sites to meet the objectives outlined in **Section 3.2.3 and Table 3.1, Standards 1-2**, in the Standards and Guidelines for Consultant Archaeologists (Government of Ontario 2011). Location 10 (AkHa-28), Location 16 (AkHa-30), and Location 22 (AkHa-32) were each subject to a CSP that met all requirements outlined in Section 3.2.1 of the MTCS's Standards and Guidelines for Consultant Archaeologists; therefore, a CSP for these archaeological locations is not required prior to Stage 3 test unit excavation. Location 26 (AkHa-33) was identified during test pit survey and does not require a CSP. All*

fieldwork for the Stage 3 Archaeological Assessments should be completed in accordance with the Standards and Guidelines for Consultant Archaeologists (Government of Ontario 2011).

- 3) Locations 3, 5, 6, 8, 11, 13, 14, 17, 19, 20, 21, 23, 24, 25, 28, and 29 as well as the pre-contact Indigenous components of Location 1 (AkHa-23) and Location 18 (AkHa-31) have been sufficiently assessed and documented, and no further archaeological assessment is recommended for these locations or components.
- 4) *No further archaeological assessment is recommended for portions of the Study Area that were subject to Stage 2 Archaeological Assessment and no archaeological sites or resources were identified.*
- 5) *Until such time that Location 1 (AkHa-23), Location 2 (AkHa-24), Location 4 (AkHa-25), Location 7 (AkHa-26), Location 9 (AkHa-27), Location 10 (AkHa-28), Location 12 (AkHa-29), Location 15 (AlHa-52), Location 16 (AkHa-30), Location 18 (AkHa-31), Location 22 (AkHa-32), Location 26 (AkHa-33), Location 27 (AkHa-34), and the Cameron Site (AlHa-9) can undergo the recommended Stage 3 assessments, the sites should be avoided and protected by establishing 70 m “no-go” zones around the extent of each site as determined by the result of the Stage 2 Archaeological Assessment survey (Supplementary Documentation, Map 1, Tiles A-E).*

Based on the proceeding recommendations, the Aggregate Resources Act Site Plans for the proposed Caledon Pit/Quarry were recommended to include the following conditions:

- a) *A Stage 3 Archaeological Assessment is required for the following sites: Location 1 (AkHa-23), Location 2 (AkHa-24), Location 4 (AkHa-25), Location 7 (AkHa-26), Location 9 (AkHa-27), Location 10 (AkHa-28), Location 12 (AkHa-29), Location 15 (AlHa-52), Location 16 (AkHa-30), Location 18 (AkHa-31), Location 22 (AkHa-32), Location 26 (AkHa-33), Location 27 (AkHa-34), and the Cameron Site (AlHa-9).*
- b) *The limits of these archaeological sites plus a 70 m buffer shall be identified on the site plans and referred to as an “Archaeological Protection Area”.*
- c) *Alterations are prohibited within the limits of the “Archaeological Protection Area” until such time that the MTCS has entered a report(s) in the Ontario Public Register of Archaeological Reports where the report(s) recommends that the archaeological site is of no further cultural heritage value or interest.*
- d) *Any archaeological site that is of further cultural heritage value or interest that remains within the licenced area at the time of surrender of the licence will be protected through a restrictive covenant on title.*
- e) *The protected sites must be fenced (post and wire) prior to commencing extraction.*

To the best of our knowledge, no additional archaeological assessments have been conducted within the limits of the current Study Area or within 50 m of the Study Area.

Information concerning specific site locations is protected by provincial policy and is not fully subject to the *Freedom of Information Act*. The release of such information in the past has led to looting or various forms of illegally conducted site destruction. Confidentiality extends to all media capable of conveying location, including maps, drawings, or textual descriptions of a site location. For this reason, maps and data that provide information on archaeological site locations are provided as supplementary documentation and do not form part of this public report.

The MCM will provide information concerning site location to the party or an agent of the party holding title to a property, or to a licensed archaeologist with relevant cultural resource management interests.

4.0 STAGE 3 METHODOLOGY

4.1 Field Methodology

The Stage 3 AA of Location 1 (AkHa-23) was conducted over a total of 15 days from May 18 to July 19, 2022, under archaeological consulting license P364 issued to Michael Teal of WSP by the MCM (P364-0200-2022). Nicole Gavin (P1288), delegated licensed archaeologist for WSP, assumed responsibility of undertaking the archaeological fieldwork at the site as per Section 12 of the MCM's 2013 *Terms and Conditions for Archaeological Licences*, issued in accordance with clause 48(4)(d) of the *Ontario Heritage Act* (Government of Ontario 1990c).

The weather during the assessment was variable (see Table 3). At no time were the conditions detrimental to the observation or recovery of archaeological material.

Table 3: Weather During the Stage 3 Site-Specific Assessment of Location 1 (AkHa-23)

Date	Temperature	Weather Conditions
May 18, 2022	12°C	Overcast
May 19, 2022	8°C	Overcast
May 20, 2022	10°C	Overcast, partly cloudy
May 24, 2022	15°C	Sunny
May 25, 2022	18°C	Sunny, overcast
May 26, 2022	20°C	Overcast
May 30, 2022	31°C	Sunny
May 31, 2022	31°C	Overcast
June 1, 2022	26°C	Overcast
June 2, 2022	19°C	Overcast
June 3, 2022	22°C	Sunny
June 6, 2022	15°C	Overcast
June 8, 2022	23°C	Sunny
June 9, 2022	22°C	Overcast
July 19, 2022	40°C	Sunny

Photo locations are illustrated on Map 6. All activities undertaken during the assessment were in compliance with the *Ontario Heritage Act* (Government of Ontario 1990c) and the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011).

All coordinates and elevations for the Stage 3 AA were collected with a Trimble Geo7x Global Navigation Satellite System (GNSS) unit using the UTM NAD 83 (Zone 17) datum and coordinated within the Cansel network (Can-Net) for base station references. The collected coordinates are provided as a six-digit easting with three decimal places, and a seven-digit northing with three decimal places. As the coordinates are a fixed spatial position, each survey observation can be considered a permanent and known datum point regardless of any future disturbance to the location of each observation. The GNSS receiver is a dual frequency differential GPS (DGPS) capable of

real time kinematic (RTK) corrections within the Can-Net Virtual Reference Station (VRS) network. The collected coordinates provide real time accuracy between 1 to 3 cm.

Location 1 (AkHa-23) was relocated from the original Stage 2 AA data. As a controlled surface pickup (CSP) that met all requirements outlined in Section 3.2.1 of the MCM's *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) was conducted for Location 1 (AkHa-23) as part of the Stage 2 AA, the Stage 3 AA began with test unit excavations. Location 1 (AkHa-23) was identified as a post-contact artifact scatter that spans 80 m (N-S) by 75 m (E-W) area, and as such, the Stage 3 excavation strategy of test units followed Section 3.2.2, Standards 1-12 of the MCM's *Draft 19th Century Rural Historical Farmstead Sites: Standards for Consultant Archaeologists* (Draft RHF Standards) (Government of Ontario 2021). The Stage 3 AA of Location 1 (AkHa-23) piloted the Draft RHF Standards as the fieldwork occurred during the 2022 pilot period. A 10 m excavation grid was placed over the Stage 2 artifact scatter, and additional test units, amounting to 40% of the initial grid unit total, were placed and excavated in areas of interest within the site. The grid was established across the extent of the site, as determined by the Stage 2 surface finds and positive test pits (Map 6). The grid squares are referred to by the intersection coordinates of their southwest corner. Each 5 m² set was further subdivided into 25 1 m² units, with sub-square number one located in the southwest corner of the 5 m² set, number five in the southeast corner, number six located immediately north of number one, and so on.

Each 1 m² test unit was excavated to ploughzone topsoil-subsoil interface which was then shovel shined and examined for evidence of subsurface cultural features prior to excavation to a depth of 5 cm into the subsoil. A test pit ("sondage") was excavated in each unit to confirm that the identified subsoil horizon does not represent a fill layer under which cultural or natural topsoil layers were present. All soil was screened through 6 mm hardware cloth to facilitate the recovery of small artifacts (Image 1 and Image 2). The Stage 3 excavation of Location 1 (AkHa-23) consisted of 40 grid units and 17 infill units for a total of 57 Stage 3 test units across an area measuring 80 m (N-S) by 70 m (E-W) (Map 6; Supplementary Documentation, Map SD1).

Seven subsurface cultural features were identified during the Stage 3 AA (see Section 5.2 below). All features were trowelled to expose their plan views as per Section 4.2.2, Standard 7a of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011). In some cases, a small number of artifacts were recovered from the surface of some features during this process. Features 6 and 7 were partially excavated following Section 3.2.2, Standard 8a of the RHF Standards (Government of Ontario 2021) to aid in determining their nature and a sample of artifacts was retained from each of these features. All features, whether partially excavated or not were recorded, drawn, and photographed before being covered with geotextile and backfilled. Partially excavated features were documented per Section 4.2.2, Standards 7a and d for the excavation of cultural features of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011). All other Stage 3 test units were backfilled upon completion.

All excavated artifacts were recorded with reference to their unit provenience and retained for laboratory analysis and description, as per Section 6.0 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011).

4.2 Artifact Analysis and Curation Methodology

This report and the following artifact inventory (Appendix A) provide a record of the artifacts and sampled material recovered from the study area/site. This information provides a basis for interpretation of the site. This report aims to offer enough artifact information that a future researcher may determine whether the study area/site is of relevance to their investigation.

4.2.1 The Artifact Inventory System

The artifact inventory was compiled on a Microsoft Access for Microsoft 365 MSO (Version 2202) database.

Each entry in the database contains the following information about a single artifact, or group of artifacts that all fit the same description:

- An individual inventory identification number,
- The spatial location (provenience) within the study area/site (operation, sub-operation, stratum/lot) from which the artifact(s) came,
- The artifact(s) analysis; and,
- The quantity of the entry (how many artifacts).

4.2.2 Artifact Analysis

The artifact analysis was based upon the MCM standard requirements, as set out in Tables 6.1 and 6.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011). Every artifact entry in the database includes material composition, artifact type (object), and the function which it served and if any alterations had been made to the original artifact (e.g., burning). Additional artifact descriptions are based upon the type of artifact (see below).

4.2.3 Indigenous Artifact

Indigenous artifacts include lithic debitage that was recorded by descriptive category (reduction, thinning, etc.).

4.2.4 Euro-Canadian Artifacts

Euro-Canadian artifacts found during this investigation, included: ceramic objects, glass items, and other inorganic and organic cultural objects (metal, stone, flora, fauna). Ceramic ware and glaze types were provided, as well as their decoration and colours. When a maker's mark was visible, it was recorded. Date ranges were provided where possible, and the reference cited. Glass artifact colours and decorative patterns were recorded, in addition to technique of manufacture when identifiable. As with ceramic material, when a marker's mark was visible it was recorded. Date ranges were provided where possible, and the reference cited. All other artifacts were described in as much detail as possible including surface treatment, decorative pattern, and technique of manufacture when identifiable.

4.2.5 Artifact Storage and Curation

The artifact collection was packed for storage by spatial location (provenience). When inventoried, artifacts were bagged in transparent, re-sealable (zippered) polyethylene bags which are inert and moisture resistant.

The contents of each artifact bag were identified on archival quality labels (acid-free, non-yellowing, acrylic adhesive), with an archival ink which is permanent and fade resistant. The artifact bags were then placed in a banker's box (12" W x 15" D x 10" H).

Artifact collections are stored in the London office archaeology lab, until the report has been submitted to the MCM, after which they will be moved to a secure, indoor, climate-controlled storage facility. This collection contains 7,692 artifacts and is packed in two standard size banker's boxes.

5.0 RECORD OF FINDS

The Stage 3 AA of Location 1 (AkHa-23) was conducted employing the methods described in Section 4.1. Map 6 illustrates the areas assessed and the method employed, while Image 1 and Image 2 illustrate the conditions during the Stage 3 fieldwork.

The UTM coordinates are listed in the Supplementary Documentation that accompanies this report separately.

The Supplementary Documentation also contains Map SD1 showing the specific locational information of Location 1 (AkHa-23)

Artifacts recovered from the Stage 3 AA of Location 1 (AkHa-23) have been washed, catalogued, and analyzed, and are stored in two banker's boxes at the WSP office in London, Ontario. Table 4 provides an inventory of the documentary record generated in the field, and a complete catalogue of all artifacts recovered during the Stage 3 assessment of the site is provided below in Appendix A.

Table 4: Inventory of Documentary Record

Document Type	Current Location of Document	Additional Comments
Field Notes	WSP Office in London	26 pages from original field notebook. Hard copies stored in project folder and digitally in project file.
Hand Drawn Maps	WSP Office in London	One from original field notebook. Hard copies stored in project folder and digitally in project file.
Maps Provided by Client	WSP Office in London	One map stored in project folder and digitally in project file.
Digital Photographs	WSP Office in London	47 photos stored in project folder and digitally in project file.

5.1 Stratigraphy

Stratigraphy at Location 1 (AkHa-23) consisted of very dark brown silty loam topsoil with 5 to 15% stone content, (Lot 1), over medium yellow-brown silty sand subsoil with 5 to 25% stone content (Lot 2) (Image 3 and Image 4). Test units ranged from 20 cm to 65 cm in depth.

5.1.1 Areas of Previous Disturbance and Fill-Capping

A review of aerial imagery dated to 2001 depicted a farmhouse at what is now the northwestern limit of Location 1 (AkHa-23) (Map SD2, Supplementary Documentation) (Town of Caledon 2022). Further review of aerial imagery suggests that the farmhouse was demolished between 2009 and 2011. Evidence of the demolition was observed in three units, including 855E 495N:1, 845E 505N:1, and 855E 505N:1, which exhibited evidence of deep and extensive ground disturbance. The three units appear to be situated within or near the northeast edge of the previous house footprint (Map 6). The demolition fill layers typically consisted of very dark brown silty loam topsoil, mottled light grey/dark brown/yellow-brown sandy or silty loam, and medium yellow-brown/grey-brown sandy loam, with gravel, mortar, brick, and wood inclusions (Image 5 and Image 6). The demolition fill yielded 394 historical and 20th century Euro-Canadian artifacts and four faunal elements.

Unit 875E 460N: 1 was located adjacent to the gravel driveway and exhibited disturbance down to the C-Horizon. The fill soils consisted of a very compact light grey silty loam, a light brown silty loam, a mottled light grey brown/dark brown silty loam, and a very dark brown loam (Image 7). These fill layers contained an intermixed deposit of construction debris and historical Euro-Canadian artifacts (n=998), as well as two faunal elements.

Artifacts recovered from the four previously disturbed units described above are out of context and, as such, are discussed separately from the undisturbed portion of the site and omitted from the overall analysis of Location 1 (AkHa-23).

Two other units adjacent to the gravel driveway exhibited fill-capping over natural soils, including units 855E 475N:12 and 865E 465N:13. The fill soil consisted of very compact light grey silty loam with gravel inclusions and ranged from 20 to 34 cm in thickness (Image 8). Historical and 20th century Euro-Canadian artifacts were recovered from the fill soils (n=125), as well as faunal elements (n=37). Only a single artifact was recovered from the buried natural topsoil horizon in unit 855E 475N: 12. Artifacts recovered from the fill soils on these two units are out of context and, as such, will be discussed separately from the undisturbed portion of the site and omitted from the overall analysis of Location 1 (AkHa-23).

The artifacts found in a disturbed context will be briefly discussed in Section 5.3.4 below.

5.2 Subsurface Features

A total of seven subsurface cultural features were identified during the Stage 3 AA of Location 1 (AkHa-23).

Feature 1 was observed in test units 885E 535N: 1 and 6, at 30 cm and 26 cm below surface. The portion of the feature that was visible in the unit floor was semi-circular to irregular in shape and situated in the northeast portion of unit 885E 535N:1 and southeast portion of unit 885E 535N: 6 (Image 9 and Image 10). The feature fill from both units was observed to be a very dark brown sandy silt with charcoal inclusions. As Feature 1 was unexcavated, no artifacts were recovered from the deposit. Feature 1 is interpreted to be an indeterminate pit feature of possible historical cultural affiliation.

Feature 2 was observed in test unit 865E 505N: 1, at 37 cm below surface. The portion of the feature that was visible in the unit floor was a linear deposit along the northern third of the unit (Image 11). The feature fill was observed to be dark brown silty loam. As Feature 2 was unexcavated, no artifacts were recovered from the deposit. Feature 2 is interpreted to be an indeterminate pit feature of possible historical affiliation.

Feature 3 was observed in test unit 855E 485N: 1, at 40 cm below surface. The portion of the feature that was visible in the unit floor was irregular in shape and situated in the southeast corner of the unit (Image 12). The feature fill was observed to be very dark brown silty loam with mortar inclusions. Through the process of defining the edges of Feature 3 by trowelling the remaining interface between the above topsoil layer and the fill of Feature 3, a sample of artifacts was retained. This included a total of 14 historical Euro-Canadian artifacts and four faunal elements that could have come from either the top of feature fill or the interface of Lot 1 (topsoil) above. Of the 14 historical Euro-Canadian artifacts, only four can be considered diagnostic, specifically one piece of refined white earthenware and three cut nails, both of which were continuously used throughout the 19th century despite their initial popularity in the mid-19th century (see Section 5.3.1 below). Also, the topsoil lot above the feature contained a temporally intermixed assemblage of mid- to late 19th century and 20th century artifacts. Feature 3 is interpreted to be an indeterminate pit feature of possible historical affiliation. It is not considered to have further CHVI as a possible discrete deposit of an earlier component of the site given the small number of artifacts recovered from

near its surface are not clearly diagnostic of an early period and could easily have come from the above intermixed topsoil rather than from the surface of the feature.

Feature 4 was found in test unit 875E 465N: 1, at 31 cm below surface. The feature covers most of the unit floor, except for the southwest corner, and appears to be semicircular in shape (Image 13). The feature fill was observed to be very dark brown silty loam. As Feature 4 was unexcavated, no artifacts were recovered from the deposit, but historical and 20th century Euro-Canadian artifacts and building components were visible in the feature fill. Feature 4 is interpreted to be an indeterminate pit feature that likely relates to the modern occupation and land-use at the site.

Feature 5 was observed in test unit 860E 490N: 14, at 34 cm below surface. The portion of the feature that was visible in the unit floor was semicircular in shape and situated centrally along the western edge of the unit (Image 14). The feature fill consisted of very dark brown loam with pebble inclusions. A large number of faunal elements (n=163) were recovered from the west side of the unit, above the apparent feature deposit, and identified as mammal bone. At the topsoil-subsoil interface, some faunal elements were visible in the feature fill and left in-situ, as Feature 5 was not excavated. Feature 5 may be a deposit of faunal elements related to small to medium sized mammal(s) but it is also possible that the feature is a small bone refuse pit, related to either the historical or modern occupation of the site.

Feature 6 was observed in test unit 880E 455N: 13, at 22 to 39 cm below surface. The feature covers most of the unit floor except for northwest corner of the unit (Image 15 and Image 16). The feature fill consisted of a layer of mottled light-yellow brown/dark brown loam over very dark grey-brown silty loam with charcoal inclusions. As per Section 3.2.2, Standard 8 of the RHF Standards, partial excavations of Feature 6 continued in the unit, between 22 and 39 cm below surface, to further investigate whether this was a stratigraphic layer or feature deposit (Government of Ontario 2021). As such, a sample of artifacts was retained from Feature 6. Thirty-seven historical and 20th century Euro-Canadian artifacts were recovered during exploratory excavations of the feature fill. Diagnostic items from the feature fill include 23 pieces of machine-made electrical insulator, three wire nails, and one cut nail. Feature 6 is interpreted to be an indeterminate pit feature that likely relates to the 20th century occupation and land-use at the site, and as such is not considered to have further CHVI as a possible discrete deposit of an earlier component of the site.

Feature 7 was observed in test unit 860E 495N: 13, at 28 to 51 cm below surface. The portion of the feature that was visible in the unit floor was triangular in shape and situated in the northwest portion of the unit (Image 17 and Image 18). The feature fill consisted of mottled dark grey brown silty loam and medium yellow-brown silty sand, with small brick and charcoal inclusions. As per Section 3.2.2, Standard 8 of the RHF Standards, partial excavations of Feature 7 continued in the unit, between 28 and 51 cm below surface, to further investigate the feature deposit (Government of Ontario 2021). Historical and 20th century Euro-Canadian artifacts were collected from the feature fill layer but were amalgamated into the total artifacts yielded from the topsoil lot. Feature 7 is interpreted to be an indeterminate pit feature that likely relates to the modern occupation and land-use at the site. Also, given the proximity of Feature 7 to the former house footprint, it is likely that it relates to the demolition of the house in the between 2009 and 2011.

5.3 Artifact Assemblage

A total of 7,692 artifacts were found during the Stage 3 AA of Location 1 (AkHa-23). The number of artifacts per test unit is provided on Map 6.

A total of 6,133 artifacts were found from an intact context during the Stage 3 AA of Location 1 (AkHa-23), including 5,677 historical and 20th Century Euro-Canadian artifacts, 454 faunal elements, and two pre-contact Indigenous artifacts.

A total of 1,559 items were recovered from fill deposits in test units that indicate previous disturbance. Based on the absence of in-situ context, artifacts recovered from fill are not discussed in detail below or presented in the succeeding analysis and conclusions section.

5.3.1 Historical and 20th Century Euro-Canadian Artifacts

The historical and 20th century Euro-Canadian artifacts are summarized by function in Table 5 and detailed in the following sections.

Table 5: Artifacts by Function

Function	# of Artifacts
arms/ammunition	8
food/beverage	1,680
fuel	49
furnishing	98
indeterminate	1,213
personal/societal	139
structural	2,433
tools/equipment	56
transportation	1
Total	5,677

5.3.1.1 Structural Artifacts

The majority of artifacts recovered from Location 1 (AkHa-23) are structural in function. Structural artifacts could be further divided into more specific categories of building components, hardware and electrical. Building component artifacts include red brick, windowpane glass, and plate glass (extra thick pane), some of it ribbed for privacy. The ribbed privacy glass recovered from the site is machine-made, which indicates a post-1900 manufacturing date. Building component artifacts also included pieces of asphalt shingle, ceramic tile, concrete, mortar, and plaster. Asphalt roofing has been manufactured in North America since 1893 (madehow.com), but the modern asphalt shingle was invented in 1903 by Henry Reynolds in Grand Rapids, Michigan, who began cutting these rolls into individual shingles. The first shingles were cut by hand, but by the 1920s, machinery had been perfected to quickly and efficiently cut shingles, making them widely and cheaply available. Asphalt shingles have continued to evolve and are now made from cellulose or fibreglass; they are still in use today (Anderson 2012). Hardware artifacts include three butt hinges, a latch hook and a rim lock. Hardware artifacts also include 1,502 nails, of which 1,148 are of a common length and 354 of a lath length. A summary of nail manufacture represented in the nail collection is provided in the table below.

Table 6: Nail Types.

Nail Types	Quantity
cut	914
indeterminate	113
wire	475
Total	1,502

There were three methods of nail manufacture that developed over time as the industry grew and became more mechanized. The first nails were hand wrought. Machine cut nails became available after 1800, when a nail cutting machine became of practical use (Vincent 1993: 159). By the 1830s machine cut nails had mostly replaced wrought nails in common use (Vincent 1993, p. 163), and continued to be used until the 1890s (Adams et al. 1994). Wire nails eventually replaced machine cut nails. They were first introduced in the 1860s but did not become common until the late 1880s to early 1890s (Miller et al 2000; Wells 2000). By 1900, wire nails were the most common nail type sold in North America and had largely taken over the nail market by 1920 with cut nails only making up about 8% of the nails being produced (Wells 2000: 327).

Electrical artifacts include 32 glass insulator fragments as well as one complete ceramic insulator (Image 19). Insulators for telephone pole wires have been manufactured since 1844 (Kovel 2005:422). The 32 fragments of glass insulator likely form two larger insulators. Both insulators are threaded which dates to a post-1865 manufacture (Miller 2000:8), as well as with “drip points”, which further dates to post-1893 (Willis 2021).

5.3.1.2 Food/Beverage Artifacts

Food/beverage function artifacts are the second most frequent artifact recovered from Location 1 (AkHa-23) and include the following specific functions.

Table 7: Food/Beverage Artifacts by Secondary Function.

Secondary Function	Quantity
beverage container	99
food container	369
food preparation	48
food waste	125
storage container	163
tableware	876
Total	1,680

5.3.1.2.1 Tableware

A total of 876 food/beverage artifacts are tableware sherds manufactured from glass or ceramic. The remaining three artifacts include two fragments of a plastic cup and an iron teaspoon. There were 12 sherds of manganese glass inventoried, recognized by its purple hue. This type of glass was not commonly used until 1890 (Lockhart

2006:54). Glass tableware forms included serving vessels, stemware, tumblers, lids, and a bowl fragment. A number of sherds could not be identified further than “glassware” or “holloware”. One piece of glassware is machine made, which indicates a post-1900 manufacturing date (Lindsey 2021). Several pieces are decorated with facets, flutes, panels, ribs and starbursts.

Ceramic artifacts include sherds from cups/mugs, pitchers, plates (bread and dinner), saucers, serving vessels, teacups and a bowl. Due to the fragmented nature, some sherds could not be identified beyond holloware or flatware. Tableware ceramics often provide the best evidence for dating artifact assemblages as they change more often than other artifacts according to popularity trends.

Ware Types

Basic ceramic ware types for the tableware assemblage are summarized in Table 8. Ware types with an asterisk have further detail below.

Table 8: Ceramic Tableware Ware Types

Ware Type	Quantity
Vitrified White Earthenware*	404
Refined White Earthenware*	289
Porcelain*	75
Indeterminate White Earthenware	51
Yellowware*	7
Rockinghamware*	6
Fine Red Earthenware	1
Total	833

White Earthenwares

Refined white earthenware (RWE) is slightly porous, white-pasted earthenware with a near colourless glaze first developed in 1805 that began to replace earlier near-white ceramics, such as creamware and pearlware, by the early 1830s. Its use continued throughout the 19th century, and is still used today, but its popularity was impacted with the introduction of vitrified white earthenware in the 1840s (Adams et al 1994; Miller 2000). A total of 289 RWE sherds were recovered from Location 1 (AkHa-23).

Vitrified white earthenware (VWE), also known as white granite, graniteware, white stone ironstone, or simply ironstone, is a variety of white-bodied earthenware with a white to greyish-white fabric that is usually thick and heavy beneath a thick, hard clear glaze with a white, greyish, or bluish tint. VWE was first developed in the 1840s but did not become popular until the second half of the 19th century. Its popularity continued into the 20th century, and it is still in use to some extent today (Sussman 1985). A total of 404 VWE sherds were recovered from Location 1 (AkHa-23).

Porcelain

Porcelain is made from a mixture of china clay (kaolin) and china stone (petuntse). Porcelaneous ware was first made in China, hence its common name *china*. Chinese porcelain is less vitrified (and therefore softer) than its modern European counterpart, which was developed in Germany in the early 18th century. Porcelain is a highly vitrified pottery with a white, fine-grained body that is usually translucent, as distinguished from earthenware, which is porous, opaque, and coarser (MACL 2016). Though there was a large amount of porcelain produced in England and Europe as early as the 18th century, on North American archaeological sites, it is most often found in post-1850 contexts (MACL 2016). A total of 75 porcelain sherds were recovered from Location 1 (AkHa-23), many of which exhibited decorative techniques that more commonly date to the late 19th century, such as decal and moulding (see below section on decorative techniques).

Yellowware

Yellowware is earthenware made from naturally coloured buff/yellow clay, covered with a clear glaze dating from 1830 to 1940 (Miller 2000), with its peak popularity after 1850 (Burke 1991). Glazed wares vary from brownish mustard to light yellow (Sussman 1997). This ware type was primarily used for food preparation and storage (Miller 2000). Seven yellowware sherds were recovered from Location 1 (AkHa-23).

Rockinghamware

Six Rockinghamware sherds were recovered from Location 1 (AkHa-23). Rockingham glaze is an uneven brown glaze that was often combined with moulded decoration on cooking vessels, teapots, pitchers, and spittoons manufactured from coarse earthenware and stoneware (MACL 2015a). It was first produced by English potters after 1788, however it was not widespread in North America until potters began producing it here in the mid-19th century (Spargo 1926; Collard 1967). Rockingham-glazed vessels were manufactured from the mid-19th century into the early 20th century, with peak popularity during the 1890s (Burke 1991).

Decoration Types

Basic ceramic tableware decoration types are summarized in Table 9 and representative examples of the decoration types found are shown in Image 20. Relevant date information is stated where available. Decoration types with an asterisk have further detail below.

Table 9: Ceramic Tableware Decoration Types

Decoration Type	Quantity	Date Range	Reference
decal: overglaze	3	Post 1890s	Huddleson 2013, p. 616
decal: underglaze	29	Post 1910s	Huddleson 2013, p. 618
edged: unscaloped, impressed, repetitive patterns	1	1840s to 1860s	Miller 2013, p. 489
edged: green	3	becomes rare by around 1840	Miller 1991:6
glaze: Rockingham	23	mid-19 th to early 20 th century (manufactured in England and NA)	Samford & Miller 2015
hand painted: blue	8	c. 1815 to 1830	Samford & Miller 2015
hand painted: late palette	7	became common in the 1830s and remained so until the 1870s	Samford & Miller 2015
industrial slip: blue banded	8	common after 1840s, into 20 th century	Miller 1991:6
lustre	12	Production peaked around 1860	Samford 2013:493
Majolica	5	Introduced in 1851	Miller 2000:13
moulded*	99	1840s to 1900	Samford & Miller 2015
sponged (closely spaced, dabbed colour)	2	common from the 1820s to the 1860s, most popular in the 1830s	Samford 2013, p. 500
sponged: cut	1	1860 to 1935	Samford 2013, p. 502
transfer printed*	52	1820 to 1840 was the period of peak production	Little 1969, p. 15

Moulded

A total of 99 mould decorated ceramic sherds were noted. Moulded tableware decoration dates from the 1840s to 1900 (Samford & Miller 2015). Decoration can be divided into three types:

- Foliage (including fruit, flowers, and leaves), dates primarily to the 1860s;
- Geometric, dates to the 1840s to 1850s; and,
- Harvest (wheat, including combinations with grapes, corn, clover, etc.), dates 1860s to 1900.

A total of 51 sherds of geometric decoration, 17 sherds of harvest decoration and two sherds of Wheat Pattern were identified. The Wheat Pattern, specifically, was patented in 1848 with its peak period of production from the 1870s to the 1880s (Sussman 1985:7).

Transfer Printed

A total of 52 sherds of ceramic with transfer print were recovered from Location 1 (AkHa-23). Transfer printed ceramic decoration began in 1750s and was developed by John Sadler and Guy Green of Liverpool. It was then adopted by Josiah Wedgwood who brought the technique into the mainstream, achieving huge popularity.

Transfer printing is a process by which a pattern or design is etched onto a copper (or other metal) plate. The plate is then inked, and the pattern is "transferred" to a special tissue. The inked tissue is then laid onto a bisque fired ceramic item, glazed, and fired again. Transfer print decoration was first produced in blue, which remains the most popular colour used, as well as other colours. The peak production date of blue transfer print is noted in the table below. Other colours found at Location 1 (AkHa-23) included black, brown, and green, which all went through periods of popularity.

Another decoration trend was "flown" colours, which became popular in the 1840s (Collard 1967:289). This decorative technique blurred or "flowed" transfer print glazes in the manufacturing process, producing a desired effect. Flow blue at Location 1 (AkHa-23) included two sherds.

Table 10: Transfer Printed Ceramic Dates

Date Range	Reference
technique invented c. 1753 (overglaze)	Kybalova 1989:212
1783 first underglaze printed patterns	Shaw 1829
1820 to 1840 was the period of peak production	Little 1969:15
declined in popularity in 1850s	Miller 1991:9
revival in the 1870s	Samford & Miller 2015
produced into the early 20 th century	Samford 1997:18
black, peak production 1825 to 1838	Samford & Miller 2015
blue, peak production 1817 to 1848	Samford & Miller 2015
brown, peak production 1829 to 1843	Samford & Miller 2015
green, peak production 1832 to 1850	Samford & Miller 2015

5.3.1.2.2 Food Container

The food container category is mostly made up of coarse red earthenware hollowware sherds that could not be identified to vessel form any further. These sherds could be fragments of storage containers (such as jars) or food preparation containers (such as bowls). There was one probable condiment/sauce bottle (n=22 sherds) with a few embossed letters legible; embossed lettering was used prior to paper labels becoming of common use by the 1920s (Fike 1987:5) (Image 21). Two can keys were also noted that likely came from a food product.

5.3.1.2.3 Storage Container

Storage containers include both glass and ceramic containers. Ceramic containers include coarse red earthenware sherds, as well as stoneware. Most of the stoneware sherds were treated with Albany slip, a dark brown slip used between 1805 and 1920 (Miller 2000:10), while nine of these sherds also exhibited a salt glaze exterior. Salt glaze generally dates to prior to the 20th century but indicates a post-1860 date when paired with Albany slip (MACL 2015b). There were 59 sherds from glass jars as well as 12 glass jar liners. Four glass jar shards exhibited an external thread finish. The external thread finish came into being in the late-19th century, however it did not become widely used until the early 20th century, when machines came to dominate bottle production and new industry-wide standards for external thread finishes and screw closures were established.

(Lindsey 2021). Also, fourteen glass jar shards exhibit machine-made seams, indicating a manufacturing date after 1900 (Lindsey 2021).

Dramatic increases in glass production in the 1890s made glass vessels somewhat more disposable (Adams 2003:45) while jar liners were patented in 1869 (Victorian Collections 2019). The number of glass container sherds recovered from Location 1 (AkHa-23) could be indicative of a late 19th century or early 20th century occupation, as before this time glass containers were much rarer, and as such, often reused and not thrown away unless broken (Schulz 2016:19). There were eight sherds of manganese glass inventoried, which was not commonly used until 1890 (Lockhart 2006:54) (Image 22).

5.3.1.2.4 Beverage Container

Glass beverage containers include soda bottles, wine bottles, general alcohol bottles, one possible sherd of a flask and two crown cap closures. Crown caps were patented in 1892 and are still in use today (Jones & Sullivan 1989, p. 163). . A total of 42 bottle sherds were identified as machine made. Although the earliest machine patent date was 1881 (Jones and Sullivan 1989:38), there were very few bottles with a narrow mouth bore that date earlier than 1910 (Lindsey 2021). Other datable attributes are noted in the following table and shown in Image 23.

Table 11: Beverage Container Datable Attributes.

Datable attribute	Quantity	Date	Reference
crown Cap Closures	2	patented in 1892	Jones & Sullivan 1989:163
lime green glass	7	almost exclusively 20th century	Lindsey 2021
enamel label	1	1934, first used commercially in the US	Lindsey 2021
machine crown finish and Consumers Glass Company mark	24	in Canada, machine-made crowns date to after 1905 (likely after 1910 when Owens machines catch on) C in an inverted triangle, registered October 1920	Lindsey 2021 King 1987:140

5.3.1.2.5 Food Waste

A total of 125 artifacts were determined to be food waste, all of which were fragments of butchered mammal bone.

5.3.1.2.6 Food Preparation

Artifacts related to food preparation included 48 ceramic bowl and milk pan sherds. Ceramic ware types included coarse earthenware and yellowware.

5.3.1.3 Indeterminate Artifacts

The function of 1,213 artifacts could not be determined. The most common type of artifact with an indeterminate function was made of glass (n=681), which includes bottles and sherds that could only be identified as holloware. Of these indeterminate glass sherds, 40 were manufactured from manganese glass, commonly used by 1890 (Lockhart 2006:54). Eight glass container shards exhibited an external thread finish. The external thread finish came into being in the late-19th century, however it did not become widely used until the early 20th century, when machines came to dominate bottle production and new industry-wide standards for external thread finishes and screw closures were established (Lindsey 2021). Furthermore, 41 glass bottle or holloware shards exhibit

machine-made seams and nine base shards exhibit an Owen's suction scar, both of which indicate a manufacturing date after 1900 (Lindsey 2021).

Other artifacts of an indeterminate function included hardware items such as bolts, nuts, screws, spikes, staples, tacks, washers, and a hook. Three screws were identified with a Robertson-style head which dates to after 1908 (Soniak 2011). Other indeterminate artifacts include fragments of iron containers, bars, rings, rods, sheet, strap, and wire. A total of 31 fragments of synthetic material (likely plastic) were also inventoried. Synthetics were only used in quantity from the turn of the 20th century.

5.3.1.4 Personal/Societal Artifacts

Personal/societal artifacts include 139 items which relate to either clothing- or health/hygiene related functions. Clothing artifacts include various buckles, buttons and other fasteners, including grommets, snaps, a strap slip, a straight pin and corset busk fragments (Image 24 and Image 25). Three Prosser type buttons were identified, which generally date to after 1840 but remained popular until the 1920s (Sprague 2002). The dust-pressing process involved mixing fine, dry clay and quartz or finely ground ceramic wasters with a small amount of moisture, pressing the mixture into moulds at high pressure, then firing the buttons at high temperature, producing very vitrified ceramic buttons (Sprague 2002). A total of eight synthetic (likely plastic) buttons were also inventoried which likely date to the 20th century. One four-hole, white metal button was impressed with "HEAD LIGHT" (obverse) and "P.DCCO/ PATENTED DEC 9. 1924" (reverse).

Health/hygiene-related artifacts include sherds from toiletry sets as well as glass sherds from small bottles. Bottle forms include cylindrical, octagonal, panel, rectangular and square. Three bottles were identified as machine made, two had a "C" in an inverted triangle on the base, indicating they were made by the Consumers Glass Company, who registered the mark in 1920 (King 1987:140). Six prescription bottle finishes were inventoried. The prescription finish is a moderately narrow one-part finish that tapers from the top surface of the finish to the bottom. It was the most common finish on drugstore and prescription bottles from the mid-1870s until the early 1920s (Lindsey 2021). Another bottle was noted with a druggist capacity mark (stylized 3), which indicates a production date of after 1900 (Lindsey 2021). The embossed lettering on two panel glass bottle sherds included part of the words "NORTHROP & LYMAN CO LTD/TORONTO CANADA". Northrop and Lyman bottles were embossed as early as the 1860s and labelled in this style into the 1940s (Fike 1987:110).

One coin was recovered; a Canadian nickel dated to 1971. Recreation-related items (n=14) include eight fragments of children's toys and six porcelain doll fragments (Image 26). These likely date prior to 1920s before synthetics (i.e., plastics, etc.) began to be used (Antiques Roadshow 2008:242). Porcelain dolls, also known as bisque dolls, are made of bisque porcelain, an unglazed form of porcelain that has a matte texture which is considered more skin like. Manufacturing of bisque dolls began in the 1860s in France and Germany, continuing well into the early 20th century (History of Dolls 2020). Two marbles were inventoried, one of them a "Cat's Eye" style. Cat's Eye marbles were first introduced in Japan in the 1950s (akronmarbles.com). Four toys were inventoried with synthetic/plastic parts including two small cars, a figure and a block. These likely dated to the post 1920s when synthetics first began to be used in quantity. Two fragments of clay smoking pipes were also inventoried. Other personal/societal-related artifacts included a possible jewellery clasp.

5.3.1.5 Furnishing Artifacts

Furnishing related artifacts include 92 sherds of glass lamp chimney glass. Many of these sherds were identified by their decorative upper rim (Image 27). Decorated upper rims were not popular in Canada until after 1885

(Woodhead, Sullivan, Gusset 1984:62). A few of these sherds were identified as manganese glass, which was manufactured between 1870 and 1920 (Lockhart 2006:54).

Other items include furniture hardware such as a caster, a drawer pull and a key. Also inventoried were a mirror sherd and a small ceramic bird. The base of the bird was embossed with the potter "WADE ENGLAND". Known as "Wade Whimsies" these small figures were first manufactured in the 1950s and starting in 1967 gained popularity as promotional items for Red Rose Tea (redrosetea.com).

5.3.1.6 Tools/Equipment Artifacts

Tools/equipment related artifacts could be further broken down into the categories of agricultural, cleaning, horse related, writing and indeterminate (Image 28). Indeterminate tools included fragments of commonplace tools such as screwdrivers, a wrench, and a drill. Agricultural equipment includes flowerpot sherds and a sickle mower blade tooth. Cleaning artifacts include 13 clothes pin springs, which were patented in 1887 (Miller 2000:15). Horse related artifacts include a buckle, a harness bell, and machine cut horseshoe nails. Writing related artifacts include a sherd of Derbyshire glazed stoneware ink well or bottle, a slate pencil, and a yellow plastic "BIC pen". The first Bic pen was released in 1950 (DesignMuseum.org).

5.3.1.7 Fuel Artifacts

A total of 48 pieces of clinker, coal, and charcoal were recovered from Location 1 (AkHa-23).

5.3.1.8 Arms/Ammunition Artifacts

The arms/ammunition artifacts from Location 1 (AkHa-23) include eight copper alloy cartridges; six are .22 calibre, and two could not be identified. Metallic cartridges were not widely used until the 1860s (Heard 2008:336). Cartridges of the .22 calibre were introduced in 1871 (Bradley 2008:5).

5.3.1.9 Transportation Artifacts

The single transportation-related artifact is a fragment of an automobile headlight.

5.3.2 Faunal Elements

A total of 454 indeterminate faunal elements were recovered from Location 1 (Akha-23). The faunal assemblage includes 397 indeterminate fragments of mammal bone, 30 indeterminate fragments of mammal dentition, 26 indeterminate fragments of avian bone, and one mollusc shell fragment. Of the mammal bone fragments, 38 pieces were identified as calcined.

5.3.3 Pre-Contact Indigenous Artifacts

A total of two pre-contact Indigenous artifacts were recovered from Location 1 (AkHa-23), both of which are pieces of lithic debitage, including one biface thinning flake and one flake fragment. Both flakes are made of Onondaga chert (Image 29).

Onondaga chert is a high-quality raw material found within the Onondaga Formation that outcrops along the north shore of Lake Erie west of the mouth of the Grand River as far west as Nanticoke, east of the mouth of the Grand River as far east as Fort Erie, and along the Onondaga Escarpment between Cayuga and Hagersville (Telford and Tarrant 1975). This material can also be recovered from secondary, glacial deposits across much of southwestern Ontario, east of Chatham (Eley and von Bitter 1989; Fox 2009:361-362).

5.3.4 Artifacts from a Disturbed Fill Context

As described above in Section 5.1, a total of 1,559 items were recovered from four disturbed test units and two fill-capped test units. The historical Euro-Canadian assemblage recovered from the fill deposits consisted primarily of structural items (n=964), followed by lesser amounts of indeterminate artifacts (n=281), food/beverage related artifacts (n=158), furnishing artifacts (n=36), personal/societal items (n=10), tools/equipment artifacts (n=9), and a fuel artifact. The faunal elements recovered from a fill context include 41 mammal bone fragments and two avian bone fragments. The 56 20th century items recovered from fill include 33 shards of machine-made glass items, 10 fragments of vehicle headlight, eight plastic items, two Canadian pennies from 1932 and 1971 respectively, and one Robertson screw. Lastly, one pre-contact Indigenous artifact was recovered from a fill context, specifically a flake fragment made of Onondaga chert.

5.4 General Site Distribution – Intact Context

The frequency of artifacts across Location 1 (AkHa-23) is shown on Map 6 and Map 7. The site is primarily located in a vacant residential lot that was continuously occupied from the mid- to late 19th century and up until approximately the early 21st century (2009 to 2011). The largest concentration of material is located immediately south of the footprint of the demolished farmhouse, between the former area of the house and an existing lilac bush. Specifically, this area includes four units located at 865E 490:1 (n=1,031), 860E 490N: 14 (n=829), 865E 495N:1 (n=643), and 860E 495N:13 (n=394). The number of artifacts recovered from these units varies between 394 and 1,013 total artifacts, with unit 865E 490N: 1 yielding the highest count for the site (n=1,013). Most of the diagnostic artifacts recovered from unit 865E 490N: 1 date to either the mid- 19th century (n=181) or late 19th century (n=192), with a relatively high number of 20th century (n=47) items also recovered (Map 7).

Spatially, there were no distinct cultural soil strata were identified during the Stage 3 AA as all artifacts were recovered from the natural topsoil horizon (where intact) across the site. The spatial distribution of diagnostic artifacts at Location 1 (AkHa-23) is shown on Map 7. Overall, similar amounts of mid- and late 19th century artifacts are distributed across the site, with most of the diagnostic assemblage consisting of structural and food/beverage-related artifacts (see Section 6.0 below). Items that were diagnostic to the 20th century are also intermixed throughout the site, which likely relates to the continuous occupation of the residential lot up until approximately the early 21st century (2009 to 2011).

6.0 ANALYSIS AND CONCLUSIONS

6.1 Historical Euro-Canadian Component

Location 1 (AkHa-23) is a domestic refuse site and homestead that relates to the continuous occupation of the lot from the mid- to late 19th century to the 20th century. Historically, it is likely associated with the McNichols family who purchased the northeast quarter of Lot 15 in 1862 from Thomas McGolderick (McGoldrick). Even though the patent for the 200-acre Lot 15 was originally granted to Joseph Brown Jr. in 1822 as a United Empire Loyalist (U.E.L.) land grant (Ontario Land Registry, n.d.(a): 306), and then sold to Solomon John Johnson Brown in June 1847, the Brown-family owners of Lot 15 do not appear in the census records for Caledon Township. This indicates that the Brown family was not occupying Lot 15, Concession 4 WSCR during their years of ownership but still retained the land for agriculture use by local farmers. The McGoldrick family retained ownership of the west 50 acres and took out two mortgages on the land; and, from 1866 to 1867, the land was transferred by indenture three times. The third and final transfer was from James Cameron to Thomas McNichol in March 1867 for \$850 (Ontario Land Registry, n.d.(b): 431). By 1871, the Census records show Thomas McNichol listed as the owner of the east 100 acres of Lot 15, Concession 4 WSCR, with one house and one barn (1871 Census, Schedule 3: 8). The house and barn referred to in the 1871 Census likely corresponds to the former farmhouse that was demolished between 2009 and 2011. Furthermore, the 1877 *Illustrated Historical Atlas* map shows Thomas McNichol as the owner of the east half of Lot 15, Con. 4 WSCR with one structure and orchards on the part of the property accessed from the concession road to the northeast (Walker and Miles 1877, Map 3). It is possible that the location discrepancy between the 1877 historical map and the position of the existing residential lot is a recording error, particularly given the archaeological evidence, or lack thereof, within this portion of the Study Area. Thomas McNichols continued to own the east 100-acres of Lot 15 until he sold the land in January 1912 to John A. McEachern for \$9100 (Ontario Land Registry, n.d.(b): 431).

Most of the artifacts recovered from Location 1 (AkHa-23) are structural items (n=2,433, 43% of the total assemblage) which consist of mostly nails, as well as building component materials (brick, mortar, concrete, tile, asphalt), shards of windowpane glass, electrical insulators, and other miscellaneous metal hardware. This is followed by similar amounts of food/beverage related artifacts (n=1,680, 30% of the total assemblage), including ceramic tableware and containers, glass food and beverage containers, and food waste, and finally artifacts with an indeterminate function (n=1,213, 21% of the total assemblage), including pieces of metal hardware, glass container sherds, and synthetic items. The dateable assemblage (n=2,561, 45.1% of the total assemblage), mostly consisted of nails (54% of the dateable assemblage) and tableware (31.5% of the dateable assemblage), which primarily date to the mid- or late 19th century, except 29 sherds of tableware that date to the 20th century. Overall, the late 19th-century and 20th century material consists of 53% of the dateable assemblage, while the remaining 47% dated to pre-1870. No artifacts that were recovered date to the early 19th century. Table 12 provides a breakdown of the dateable artifacts from the assemblage, while Section 5.3.1 provided the dating information for diagnostic artifacts found within each functional category.

Table 12: Location 1 (AkHa-23) Dateable Artifacts

Artifact	Freq.	% of Total Assemblage	% of Dateable Assemblage
Mid-19th Century Artifacts			
Machine-Cut Nails	914	16.10%	35.83%
RWE	285	5.02%	11.17%
Yellowware, Plain	8	0.14%	0.31%

Artifact	Freq.	% of Total Assemblage	% of Dateable Assemblage
Subtotal	1207	21.26%	47.31%
Late 19th Century Artifacts			
Wire-Drawn Nails	475	8.37%	18.62%

1950s Small Ceramic Bird	1	0.02%	0.04%
Cats-Eye Marble	1	0.02%	0.04%
Ribbed Privacy Glass (Window)	4	0.07%	0.16%
Subtotal	234	4.12%	9.17%
GRAND TOTAL	2551	44.94%	100.00%

The Location 1 (AkHa-23) artifact assemblage consists of material that is typically associated with domestic occupations (i.e., structural artifacts, food and beverage-related items, glass containers of indeterminate function, etc.). These findings are generally consistent with the conclusions derived from the Stage 2 artifact assemblage from Location 1 (AkHa-23) (Golder 2022).

Seven subsurface features were identified during the Stage 3 AA of Location 1 (AkHa-23). Most of the features identified, except for Feature 5, were interpreted as indeterminate pit features of either possible historical affiliation or are related to the 20th century or modern land-use of the site. Feature 5 was interpreted to be a small faunal bone refuse pit (see Section 5.2). The majority of these indeterminate pit features are located within the residential portion of the site between the footprint of the demolished farmhouse and outbuilding at the south end of the lot.

Location 1 (AkHa-23) can be contrasted with Location 9 (AkHa-27) which is situated approximately 400 m to the southwest of the site within Lot 15 (WSP 2023a). Location 9 (AkHa-27) is interpreted to be a mid-19th century domestic refuse deposit and a possible “back forty dump” site (MacDonald 1997: 60; WSP 2023a:30). Given the mid- to late 19th century components of both sites, it is likely that each was occupied concurrently. However, Location 9 (AkHa-27) may be a discrete refuse deposit related specifically to the McGoldrick family, who retained 50 acres of the adjacent portion of Lot 15 from 1862 to 1867.

Based on the above findings, WSP concludes that a sufficient level of archaeological data has been revealed to provide an understanding of the mid- to late 19th century occupation of the McNichols family and assess the CHVI of the site. Location 1 (AkHa-23) does not meet Standard 2c of Section 3.4 of the Draft RHF Standards (Government of Ontario 2021), or Standards 1a-b of Section 3.4.2 of the *Standards and Guidelines for Consultant Archaeologists* (Government of Ontario 2011) for domestic archaeological sites dating after 1830. As such, the historical Euro-Canadian component of Location 1 (AkHa-23) is determined to have been sufficiently documented and is concluded to have no further CHVI. Therefore, Location 1 (AkHa-23) does not require Stage 4 mitigation prior to development impacts.

6.2 Pre-Contact Indigenous Component

The pre-contact Indigenous artifact assemblage consisted of two pieces of lithic debitage made of Onondaga chert. Lithic debitage is not a diagnostic artifact type and therefore cannot be assigned a specific occupational time period or specific cultural affiliation. The isolated nature of the artifacts could be attributed to being inadvertently intermixed with the historical material and redeposited sometime during the historical occupation.

7.0 RECOMMENDATIONS

Based on the results of the Stage 3 AA of Location 1 (AkHa-23), and the analysis and conclusions presented in Section 6.0, Location 1 (AkHa-23) has no further cultural heritage value or interest and is not recommended for Stage 4 mitigation of impacts.

The Ontario Ministry of Citizenship and Multiculturalism is asked to review the results and recommendations presented herein, accept this report into the Provincial Register of archaeological reports and issue a standard letter of compliance with the Ministry's 2011 *Standards and Guidelines for Consultant Archaeologists* and the terms and conditions for archaeological licencing.

8.0 ADVICE ON COMPLIANCE WITH LEGISLATION

This report is submitted to the Ministry of Citizenship and Multiculturalism as a condition of licensing in accordance with Part VI of the *Ontario Heritage Act* (Government of Ontario 1990c). The report is prepared to ensure that it complies with the standards and guidelines that are issued by the Minister, and that the archaeological fieldwork and report recommendations ensure the conservation, protection and preservation of the cultural heritage of Ontario. When all matters relating to archaeological sites within the project area of a development proposal have been addressed to the satisfaction of the Ministry of Citizenship and Multiculturalism, a letter will be issued by the Ministry stating that there are no further concerns with regards to alterations to archaeological sites by the proposed development.

It is an offence under Section 48 and 69 of the *Ontario Heritage Act* for any party other than a licensed archaeologist to make any alterations to a known archaeological site or to remove any artifact or other physical evidence of past human use or activity from the site, until such time as a licensed archaeologist has completed archaeological fieldwork on the site, submitted a report to the Minister stating that the site has no further cultural heritage value or interest, and the report has been filed in the Ontario Public Register of Archaeological reports referred to in Section 65.1 of the *Ontario Heritage Act* (Government of Ontario 1990c).

Should previously undocumented archaeological resources be discovered, they may be a new archaeological site and therefore subject to Section 48(1) of the *Ontario Heritage Act*. The proponent or person discovering the archaeological resources must cease alteration of the site immediately and engage a licensed consultant archaeologist to carry out archaeological fieldwork, in compliance with Section 48(1) of the *Ontario Heritage Act* (Government of Ontario 1990c).

The *Funeral, Burial and Cremation Services Act*, 2002, S.O. 2002, c.33, requires that any person discovering or having knowledge of a burial site shall immediately notify the police or coroner (Government of Ontario 2002). It is recommended that the Registrar of Cemeteries at the Ministry of Consumer Services is also immediately notified.
